

# Keysight X-Series Signal Analyzers

This manual provides documentation for the following model:  
N9030A PXA Signal Analyzer

PXA Specification  
Guide  
(Comprehensive  
Reference Data)

# Notices

## Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED "AS IS," AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS

DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT WILL CONTROL.

## Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

## U.S. Government Rights

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the U.S. government acquires commercial computer software under the same terms by which the software is customarily provided to the public.

Accordingly, Keysight provides the Software to U.S. government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at

<http://www.keysight.com/find/sweula>

The license set forth in the EULA represents the exclusive authority by which the U.S. government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional

government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the U.S. government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

## Safety Notices

### CAUTION

A **CAUTION** notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

### WARNING

A **WARNING** notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

## Where to Find the Latest Information

Documentation is updated periodically. For the latest information about these products, including instrument software upgrades, application information, and product information, browse to one of the following URLs, according to the name of your product:

<http://www.keysight.com/find/pxa>

To receive the latest updates by email, subscribe to Keysight Email Updates at the following URL:

<http://www.keysight.com/find/MyKeysight>

Information on preventing instrument damage can be found at:

[www.keysight.com/find/PreventingInstrumentRepair](http://www.keysight.com/find/PreventingInstrumentRepair)

## Is your product software up-to-date?

Periodically, Keysight releases software updates to fix known defects and incorporate product enhancements. To search for software updates for your product, go to the Keysight Technical Support website at:

<http://www.keysight.com/find/techsupport>

Absolute Amplitude Accuracy . . . . .	98
Amplitude Linearity . . . . .	98
IF Flatness . . . . .	98
Sensitivity. . . . .	98
Dynamic Range . . . . .	99
Third Order Intermodulation distortion . . . . .	99
Residual Responses. . . . .	99
Image Responses. . . . .	99
LO Related Spurious . . . . .	99
Other Spurious. . . . .	99
Nominal Noise Density [Plot]. . . . .	100
Analog Modulation Analysis (N9064A-1FP/1TP) . . . . .	101
AM Demodulation . . . . .	101
PM Demodulation . . . . .	101
FM Demodulation . . . . .	102
Flexible Digital Modulation Analysis (N9064A-2FP/2TP) . . . . .	103
Accuracy . . . . .	103
Residual EVM for MSK Modulation Formats . . . . .	104
Residual EVM for Video Modulation Formats. . . . .	105
WLAN Modulation Analysis (N9064A-3FP/3TP) . . . . .	106
IEEE 802.11a/g OFDM. . . . .	106
IEEE 802.11b/g DSSS . . . . .	106
 4. Option ALV - Log Video Out . . . . .	
Specifications Affected by Log Video Out . . . . .	108
Other Log Video Out Specifications . . . . .	109
Aux IF Out Port . . . . .	109
Fast Log Video Output. . . . .	109
Nominal Output Voltage (Open Circuit) versus Input Level [Plot] . . . . .	110
 5. Option B25 - 25 MHz Analysis Bandwidth . . . . .	
Specifications Affected by Analysis Bandwidth . . . . .	112
Other Analysis Bandwidth Specifications . . . . .	113
IF Spurious Response . . . . .	113
IF Frequency Response . . . . .	114
IF Phase Linearity . . . . .	115
Nominal Phase Linearity [Plot] . . . . .	115
Data Acquisition . . . . .	117
Time Record Length . . . . .	117
ADC Resolution . . . . .	117
 6. Option B40 - 40 MHz Analysis Bandwidth . . . . .	
Specifications Affected by Analysis Bandwidth . . . . .	120
Other Analysis Bandwidth Specifications . . . . .	121
SFDR (Spurious-Free Dynamic Range). . . . .	121
IF Frequency Response . . . . .	124
IF Phase Linearity . . . . .	125

Nominal Phase Linearity [Plot]	125
EVM	126
Data Acquisition	130
Time Record Length	130
ADC Resolution	130
Capture Time [Plot]	130
<b>7. Option B85/B1X - 85/160 MHz Analysis Bandwidth</b>	
Specifications Affected by Analysis Bandwidth	132
Other Analysis Bandwidth Specifications	133
SFDR (Spurious-Free Dynamic Range)	133
IF Residual Responses	135
IF Frequency Response	136
IF Phase Linearity	137
EVM measurement floor	140
Data Acquisition	143
Time Record Length	143
ADC Resolution	143
<b>8. Option BBA - Analog Baseband IQ (BBIQ) Inputs</b>	
Frequency and Time	146
Amplitude Accuracy and Range	147
Nominal Channel Match, 50 $\Omega$ Input, Single-Ended input mode, 0.25V Range [Plot]	149
Nominal Phase Match, 50 $\Omega$ Input, Single-Ended input mode, 0.25V Range [Plot]	149
Dynamic Range	151
Application Specifications	153
Measurements	156
General	161
Capture Length vs. Span, 2-channel with 89600 VSA, I+jQ Mode [Plot]	162
Inputs/Outputs	163
<b>9. Option CR3 - Connector Rear, 2nd IF Output</b>	
Specifications Affected by Connector Rear, 2nd IF Output	166
Other Connector Rear, 2nd IF Output Specifications	167
Aux IF Out Port	167
Second IF Out	167
<b>10. Option CRP - Connector Rear, Arbitrary IF Output</b>	
Specifications Affected by Connector Rear, Arbitrary IF Output	170
Other Connector Rear, Arbitrary IF Output Specifications	171
Aux IF Out Port	171
Arbitrary IF Out	171
<b>11. Option EA3 - Electronic Attenuator, 3.6 GHz</b>	
Specifications Affected by Electronic Attenuator	174
Other Electronic Attenuator Specifications	175
Range (Frequency and Attenuation)	175
Distortions and Noise	176

Frequency Response . . . . .	177
Absolute Amplitude Accuracy . . . . .	178
Electronic Attenuator Switching Uncertainty . . . . .	179
<b>12. Option EMC - Precompliance EMI Features</b>	
Frequency . . . . .	182
Frequency Range . . . . .	182
EMI Resolution Bandwidths . . . . .	182
Amplitude . . . . .	184
EMI Average Detector . . . . .	184
Quasi-Peak Detector . . . . .	184
RMS Average Detector . . . . .	184
<b>13. Option ESC - External Source Control</b>	
General Specifications . . . . .	186
Frequency Range . . . . .	186
Dynamic Range . . . . .	188
Power Sweep Range . . . . .	188
Measurement Time . . . . .	189
Supported External Sources . . . . .	190
<b>14. Option EXM - External Mixing</b>	
Specifications Affected by External mixing . . . . .	192
Other External Mixing Specifications . . . . .	193
Connection Port EXT MIXER . . . . .	193
Mixer Bias . . . . .	193
IF Input . . . . .	193
LO Output . . . . .	194
<b>15. Option LNP - Low Noise Path Specifications</b>	
Specifications Affected by Low Noise Path . . . . .	196
Displayed Average Noise Level . . . . .	197
DANL (with Noise Floor Extension) Improvement . . . . .	198
Frequency Response . . . . .	199
Second Harmonic Distortion . . . . .	200
Dynamic Range Plots . . . . .	201
Nominal Dynamic Range . . . . .	201
<b>16. Option MPB - Microwave Preselector Bypass</b>	
Specifications Affected by Microwave Preselector Bypass . . . . .	204
Other Microwave Preselector Bypass Specifications . . . . .	205
Frequency Response . . . . .	205
Additional Spurious Responses . . . . .	206
<b>17. Options P03, P08, P13, P26, P43, P44 and P50 - Preamplifiers</b>	
Specifications Affected by Preamp . . . . .	208
Other Preamp Specifications . . . . .	209

Gain . . . . .	209
Noise figure . . . . .	209
1 dB Gain Compression Point . . . . .	210
Displayed Average Noise Level (DANL) (without Noise Floor Extension) . . . . .	211
Frequency Response – Preamp On . . . . .	214
RF Input VSWR . . . . .	216
Nominal VSWR – Preamp On Low Band (Plot) . . . . .	217
Nominal VSWR – Preamp, Above 3.5 GHz [Plot]. . . . .	218
Second Harmonic Distortion . . . . .	219
Third Order Intermodulation Distortion . . . . .	219
Nominal Dynamic Range at 1 GHz, Preamp On (Plot). . . . .	220
<b>18. Options RT1, RT2 – Real-time Spectrum Analyzer (RTSA)</b>	
Real-time Spectrum Analyzer Performance . . . . .	222
General Frequency Domain Characteristics. . . . .	222
Density View . . . . .	223
Spectrogram View. . . . .	223
Power vs. Time . . . . .	224
Frequency Mask Trigger (FMT). . . . .	225
<b>19. Option YAV – Y-Axis Video Output</b>	
Specifications Affected by Y-Axis Video Output . . . . .	228
Other Y-Axis Video Output Specifications . . . . .	229
General Port Specifications . . . . .	229
Screen Video . . . . .	229
Continuity and Compatibility . . . . .	230
Delay . . . . .	230
Log Video Output . . . . .	232
Linear Video (AM Demod) Output . . . . .	232
<b>20. Analog Demodulation Measurement Application</b>	
RF Carrier Frequency and Bandwidth . . . . .	235
Carrier Frequency . . . . .	235
Maximum Information	
Bandwidth (Info BW) . . . . .	235
Capture Memory . . . . .	235
Post-Demodulation . . . . .	236
Maximum Audio	
Frequency Span . . . . .	236
Filters. . . . .	236
Frequency Modulation . . . . .	238
Conditions required to meet specification . . . . .	238
FM Deviation Accuracy. . . . .	238
FM Rate Accuracy. . . . .	238
Carrier Frequency Error. . . . .	238
Carrier Power . . . . .	238
Frequency Modulation . . . . .	239
Post-Demod Distortion Residual . . . . .	239

Post-Demod Distortion Accuracy . . . . .	239
Distortion Measurement Range . . . . .	239
AM Rejection	
(50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW) . . . . .	239
Residual FM . . . . .	239
Hum & Noise . . . . .	239
Amplitude Modulation . . . . .	241
Conditions required to meet specification . . . . .	241
AM Depth Accuracy . . . . .	241
AM Rate Accuracy . . . . .	241
Carrier Power . . . . .	241
Amplitude Modulation . . . . .	242
Post-Demod Distortion Residual . . . . .	242
Post-Demod Distortion Accuracy . . . . .	242
Distortion Measurement Range . . . . .	242
FM Rejection	
(300 Hz HPF, 3 kHz LPF, 420 kHz Channel BW) . . . . .	242
Residual AM	
(300 Hz HPF, 3 kHz LPF, 15 kHz Channel BW) . . . . .	242
Phase Modulation . . . . .	243
Conditions required to meet specification . . . . .	243
PM Deviation Accuracy . . . . .	243
PM Rate Accuracy . . . . .	243
Carrier Frequency Error . . . . .	243
Carrier Power . . . . .	243
Phase Modulation . . . . .	244
Post-Demod Distortion Residual . . . . .	244
Post-Demod Distortion Accuracy . . . . .	244
Distortion Measurement Range . . . . .	244
AM Rejection	
(50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW) . . . . .	244
Analog Out . . . . .	245
FM Stereo/Radio Data System (RDS) Measurements . . . . .	246
FM Stereo Modulation Analysis Measurements . . . . .	246
<b>21. Noise Figure Measurement Application</b>	
General Specifications . . . . .	250
Noise Figure . . . . .	250
Gain . . . . .	251
Noise Figure Uncertainty Calculator . . . . .	252
Uncertainty versus Calibration Options . . . . .	253
Nominal Noise Figure Uncertainty versus Calibration Used . . . . .	253
Nominal Instrument Noise Figure . . . . .	254
Nominal Instrument Input VSWR, DC Coupled . . . . .	255
<b>22. Phase Noise Measurement Application</b>	
General Specifications . . . . .	258
Maximum Carrier Frequency . . . . .	258

Measurement Characteristics	258
Measurement Accuracy	259
Offset Frequency	260
Amplitude Repeatability	260

# 1 PXA Signal Analyzer

This chapter contains the specifications for the core signal analyzer. The specifications and characteristics for the measurement applications and options are covered in the chapters that follow.

## Definitions and Requirements

This book contains signal analyzer specifications and supplemental information. The distinction among specifications, typical performance, and nominal values are described as follows.

### Definitions

- Specifications describe the performance of parameters covered by the product warranty (temperature = 0 to 55°C<sup>1</sup> also referred to as "Full temperature range" or "Full range", unless otherwise noted).
- 95th percentile values indicate the breadth of the population ( $\approx 2\sigma$ ) of performance tolerances expected to be met in 95% of the cases with a 95% confidence, for any ambient temperature in the range of 20 to 30°C. In addition to the statistical observations of a sample of instruments, these values include the effects of the uncertainties of external calibration references. These values are not warranted. These values are updated occasionally if a significant change in the statistically observed behavior of production instruments is observed.
- Typical describes additional product performance information that is not covered by the product warranty. It is performance beyond specification that 80% of the units exhibit with a 95% confidence level over the temperature range 20 to 30°C. Typical performance does not include measurement uncertainty.
- Nominal values indicate expected performance, or describe product performance that is useful in the application of the product, but is not covered by the product warranty.

### Conditions Required to Meet Specifications

The following conditions must be met for the analyzer to meet its specifications.

- The analyzer is within its calibration cycle. See the General section of this chapter.
- Under auto couple control, except that Auto Sweep Time Rules = Accy.
- For signal frequencies < 10 MHz, DC coupling applied.
- Any analyzer that has been stored at a temperature range inside the allowed storage range but outside the allowed operating range must be stored at an ambient temperature within the allowed operating range for at least two hours before being turned on.

---

1. For earlier instruments (S/N < MY49430337/SG49430006/US49230450), the operating temperature ranges from 5 to 50°C

- The analyzer has been turned on at least 30 minutes with Auto Align set to Normal, or if Auto Align is set to Off or Partial, alignments must have been run recently enough to prevent an Alert message. If the Alert condition is changed from “Time and Temperature” to one of the disabled duration choices, the analyzer may fail to meet specifications without informing the user.

## Certification

Keysight Technologies certifies that this product met its published specifications at the time of shipment from the factory. Keysight Technologies further certifies that its calibration measurements are traceable to the United States National Institute of Standards and Technology, to the extent allowed by the Institute’s calibration facility, and to the calibration facilities of other International Standards Organization members.

## Frequency and Time

Description	Specifications		Supplemental Information
<b>Frequency Range</b>			
Maximum Frequency			
<i>Option 503</i>	3.6 GHz		
<i>Option 508</i>	8.4 GHz		
<i>Option 513</i>	13.6 GHz		
<i>Option 526</i>	26.5 GHz		
<i>Option 543</i>	43 GHz		
<i>Option 544</i>	44 GHz		
<i>Option 550</i>	50 GHz		
Preamp <i>Option P03</i>	3.6 GHz		
Preamp <i>Option P08</i>	8.4 GHz		
Preamp <i>Option P13</i>	13.6 GHz		
Preamp <i>Option P26</i>	26.5 GHz		
Preamp <i>Option P43</i>	43 GHz		
Preamp <i>Option P44</i>	44 GHz		
Preamp <i>Option P50</i>	50 GHz		
Minimum Frequency			
Preamp	AC Coupled <sup>a</sup>	DC Coupled	
Off	10 MHz	3 Hz	
On	10 MHz	9 kHz	
<b>Band</b>	<b>Harmonic Mixing Mode</b>	<b>LO Multiple (N<sup>b</sup>)</b>	Band Overlaps <sup>c</sup>
0 (3 Hz to 3.6 GHz) <sup>d</sup>	1–	1	<i>Options 503, 508, 513, 526, 543, 544, 550</i>
1 (3.5 to 8.4 GHz)	1–	1	<i>Options 508, 513, 526, 543, 544, 550</i>
2 (8.3 to 13.6 GHz)	1–	2	<i>Options 513, 526, 543, 544, 550</i>

PXA Signal Analyzer  
Frequency and Time

Description	Specifications		Supplemental Information
3 (13.5 to 17.1 GHz)	2–	2	<i>Options 526, 543, 544, 550</i>
4 (17.0 to 26.5 GHz)	2–	4	<i>Options 526, 543, 544, 550</i>
5 (26.4 to 34.5 GHz)	2–	4	<i>Options 543, 544, 550</i>
6 (34.4 to 50 GHz)	4–	8	<i>Options 543, 544, 550</i>

- a. AC Coupled only applicable to Freq *Options 503, 508, 513, and 526*.
- b. N is the LO multiplication factor. For negative mixing modes (as indicated by the “–” in the “Harmonic Mixing Mode” column), the desired 1st LO harmonic is higher than the tuned frequency by the 1st IF.
- c. In the band overlap regions, for example, 3.5 to 3.6 GHz, the analyzer may use either band for measurements, in this example Band 0 or Band 1. The analyzer gives preference to the band with the better overall specifications (which is the lower numbered band for all frequencies below 26 GHz), but will choose the other band if doing so is necessary to achieve a sweep having minimum band crossings. For example, with CF = 3.58 GHz, with a span of 40 MHz or less, the analyzer uses Band 0, because the stop frequency is 3.6 GHz or less, allowing a span without band crossings in the preferred band. If the span is between 40 and 160 MHz, the analyzer uses Band 1, because the start frequency is above 3.5 GHz, allowing the sweep to be done without a band crossing in Band 1, though the stop frequency is above 3.6 GHz, preventing a Band 0 sweep without band crossing. With a span greater than 160 MHz, a band crossing will be required: the analyzer sweeps up to 3.6 GHz in Band 0; then executes a band crossing and continues the sweep in Band 1.  
Specifications are given separately for each band in the band overlap regions. One of these specifications is for the preferred band, and one for the alternate band. Continuing with the example from the previous paragraph (3.58 GHz), the preferred band is band 0 (indicated as frequencies under 3.6 GHz) and the alternate band is band 1 (3.5 to 8.4 GHz). The specifications for the preferred band are warranted. The specifications for the alternate band are not warranted in the band overlap region, but performance is nominally the same as those warranted specifications in the rest of the band. Again, in this example, consider a signal at 3.58 GHz. If the sweep has been configured so that the signal at 3.58 GHz is measured in Band 1, the analysis behavior is nominally as stated in the Band 1 specification line (3.5 to 8.4 GHz) but is not warranted. If warranted performance is necessary for this signal, the sweep should be reconfigured so that analysis occurs in Band 0. Another way to express this situation in this example Band 0/Band 1 crossing is this: The specifications given in the “Specifications” column which are described as “3.5 to 8.4 GHz” represent nominal performance from 3.5 to 3.6 GHz, and warranted performance from 3.6 to 8.4 GHz.
- d. Band 0 is extendable (set “Extend Low Band” to On) to 3.7 GHz instead of 3.6 GHz in instruments with frequency option 508, 513 or 526 and serial number is equal with or greater than the following: US54490126, MY54490690, or SG54490127. Band 0 can also be extendable in earlier instruments with firmware of version A.16.13 or later and a field adjustment to perform that extension

PXA Signal Analyzer  
Frequency and Time

Description	Specifications	Supplemental Information
<b>Precision Frequency Reference</b>		
Accuracy	$\pm[(\text{time since last adjustment} \times \text{aging rate}) + \text{temperature stability} + \text{calibration accuracy}]^a]^b$	
Temperature Stability		
20 to 30°C	$\pm 1.5 \times 10^{-8}$	Nominally linear <sup>c</sup>
Full temperature range	$\pm 5 \times 10^{-8}$	
Aging Rate		$\pm 5 \times 10^{-10}/\text{day}$ (nominal)
Total Aging		
1 Year	$\pm 1 \times 10^{-7}$	
2 Years	$\pm 1.5 \times 10^{-7}$	
Settability	$\pm 2 \times 10^{-9}$	
Warm-up and Retrace <sup>d</sup>		Nominal
300 s after turn on		$\pm 1 \times 10^{-7}$ of final frequency
900 s after turn on		$\pm 1 \times 10^{-8}$ of final frequency
Achievable Initial Calibration Accuracy <sup>e</sup>	$\pm 4 \times 10^{-8}$	
Standby power to reference oscillator		Not supplied
Residual FM (Center Frequency = 1 GHz 10 Hz RBW, 10 Hz VBW)		$\leq 0.25 \text{ Hz} \times N^f$ p-p in 20 ms (nominal)

- Calibration accuracy depends on how accurately the frequency standard was adjusted to 10 MHz. If the adjustment procedure is followed, the calibration accuracy is given by the specification "Achievable Initial Calibration Accuracy."
- The specification applies after the analyzer has been powered on for four hours.
- Narrow temperature range performance is nominally linear with temperature. For example, for  $25 \pm 3^\circ \text{C}$ , the stability would be only three-fifths as large as the warranted  $25 \pm 5^\circ \text{C}$ , thus  $\pm 0.9 \times 10^{-8}$ .
- Standby mode does not apply power to the oscillator. Therefore warm-up applies every time the power is turned on. The warm-up reference is one hour after turning the power on. Retracing also occurs every time warm-up occurs. The effect of retracing is included within the "Achievable Initial Calibration Accuracy" term of the Accuracy equation.

PXA Signal Analyzer  
Frequency and Time

- e. The achievable calibration accuracy at the beginning of the calibration cycle includes these effects:
- 1) Temperature difference between the calibration environment and the use environment
  - 2) Orientation relative to the gravitation field changing between the calibration environment and the use environment
  - 3) Retrace effects in both the calibration environment and the use environment due to turning the instrument power off.
  - 4) Settability
- f. N is the LO multiplication factor.

Description	Specifications	Supplemental Information
<b>Frequency Readout Accuracy</b>	$\pm(\text{marker freq} \times \text{freq ref accy} + 0.10\% \times \text{span} + 5\% \times \text{RBW}^a + 2 \text{ Hz} + 0.5 \times \text{horizontal resolution}^b)$	Single detector only <sup>c</sup>
Example for EMC <sup>d</sup>		$\pm 0.0032\%$ (nominal)

- a. The warranted performance is only the sum of all errors under autocoupled conditions. Under non-autocoupled conditions, the frequency readout accuracy will nominally meet the specification equation, except for conditions in which the RBW term dominates, as explained in examples below. The nominal RBW contribution to frequency readout accuracy is 2% of RBW for RBWs from 1 Hz to 390 kHz, 4% of RBW from 430 kHz through 3 MHz (the widest autocoupled RBW), and 30% of RBW for the (manually selected) 4, 5, 6 and 8 MHz RBWs.
- First example:* a 120 MHz span, with autocoupled RBW. The autocoupled ratio of span to RBW is 106:1, so the RBW selected is 1.1 MHz. The  $5\% \times \text{RBW}$  term contributes only 55 kHz to the total frequency readout accuracy, compared to 300 kHz for the  $0.25\% \times \text{span}$  term, for a total of 355 kHz. In this example, if an instrument had an unusually high RBW centering error of 7% of RBW (77 kHz) and a span error of 0.20% of span (240 kHz), the total actual error (317 kHz) would still meet the computed specification (355 kHz).
- Second example:* a 20 MHz span, with a 4 MHz RBW. The specification equation does not apply because the Span: RBW ratio is not autocoupled. If the equation did apply, it would allow 50 kHz of error (0.25%) due to the span and 200 kHz error (5%) due to the RBW. For this non-autocoupled RBW, the RBW error is nominally 30%, or 1200 kHz.
- b. Horizontal resolution is due to the marker reading out one of the trace points. The points are spaced by  $\text{span}/(\text{Npts} - 1)$ , where Npts is the number of sweep points. For example, with the factory preset value of 1001 sweep points, the horizontal resolution is  $\text{span}/1000$ . However, there is an exception: When both the detector mode is "normal" and the  $\text{span} > 0.25 \times (\text{Npts} - 1) \times \text{RBW}$ , peaks can occur only in even-numbered points, so the effective horizontal resolution becomes doubled, or  $\text{span}/500$  for the factory preset case. When the RBW is autocoupled and there are 1001 sweep points, that exception occurs only for spans  $> 750$  MHz.
- c. Specifications apply to traces in most cases, but there are exceptions. Specifications always apply to the peak detector. Specifications apply when only one detector is in use and all active traces are set to Clear Write. Specifications also apply when only one detector is in use in all active traces and the "Restart" key has been pressed since any change from the use of multiple detectors to a single detector. In other cases, such as when multiple simultaneous detectors are in use, additional errors of 0.5, 1.0 or 1.5 sweep points will occur in some detectors, depending on the combination of detectors in use.
- d. In most cases, the frequency readout accuracy of the analyzer can be exceptionally good. As an example, Keysight has characterized the accuracy of a span commonly used for Electro-Magnetic Compatibility (EMC) testing using a source frequency locked to the analyzer. Ideally, this sweep would include EMC bands C and D and thus sweep from 30 to 1000 MHz. Ideally, the analysis bandwidth would be 120 kHz at -6 dB, and the spacing of the points would be half of this (60 kHz). With a start frequency of 30 MHz and a stop frequency of 1000.2 MHz and a total of 16168 points, the spacing of points is ideal. The detector used was the Peak detector. The accuracy of frequency readout of all the points tested in this span was with  $\pm 0.0032\%$  of the span. A perfect analyzer with this many points would have an accuracy of  $\pm 0.0031\%$  of span. Thus, even with this large number of display points, the errors in excess of the bucket quantization limitation were negligible.

PXA Signal Analyzer  
Frequency and Time

Description	Specifications	Supplemental Information
<b>Frequency Counter<sup>a</sup></b>		See note <sup>b</sup>
Count Accuracy	$\pm(\text{marker freq} \times \text{freq ref accy.} + 0.100 \text{ Hz})$	
Delta Count Accuracy	$\pm(\text{delta freq.} \times \text{freq ref accy.} + 0.141 \text{ Hz})$	
Resolution	0.001 Hz	

- a. Instrument conditions: RBW = 1 kHz, gate time = auto (100 ms), S/N  $\geq$  50 dB, frequency = 1 GHz  
b. If the signal being measured is locked to the same frequency reference as the analyzer, the specified count accuracy is  $\pm 0.100$  Hz under the test conditions of footnote a. This error is a noisiness of the result. It will increase with noisy sources, wider RBWs, lower S/N ratios, and source frequencies > 1 GHz.

Description	Specifications	Supplemental Information
<b>Frequency Span</b>		
Range		
Option 503	0 Hz, 10 Hz to 3.6 GHz	
Option 508	0 Hz, 10 Hz to 8.4 GHz	
Option 513	0 Hz, 10 Hz to 13.6 GHz	
Option 526	0 Hz, 10 Hz to 26.5 GHz	
Option 543	0 Hz, 10 Hz to 43 GHz	
Option 544	0 Hz, 10 Hz to 44 GHz	
Option 550	0 Hz, 10 Hz to 50 GHz	
Resolution	2 Hz	
Span Accuracy		
Swept	$\pm(0.1\% \times \text{span} + \text{horizontal resolution}^a)$	
FFT	$\pm(0.1\% \times \text{span} + \text{horizontal resolution}^a)$	

- a. Horizontal resolution is due to the marker reading out one of the sweep points. The points are spaced by  $\text{span}/(\text{Npts} - 1)$ , where Npts is the number of sweep points. For example, with the factory preset value of 1001 sweep points, the horizontal resolution is  $\text{span}/1000$ . However, there is an exception: When both the detector mode is "normal" and the  $\text{span} > 0.25 \times (\text{Npts} - 1) \times \text{RBW}$ , peaks can occur only in even-numbered points, so the effective horizontal resolution becomes doubled, or  $\text{span}/500$  for the factory preset case. When the RBW is auto coupled and there are 1001 sweep points, that exception occurs only for spans > 750 MHz.

PXA Signal Analyzer  
Frequency and Time

Description	Specifications	Supplemental Information
<b>Sweep Time and Trigger</b>		
Sweep Time Range Span = 0 Hz Span $\geq$ 10 Hz	1 $\mu$ s to 6000 s 1 ms to 4000 s	
Sweep Time Accuracy Span $\geq$ 10 Hz, swept Span $\geq$ 10 Hz, FFT Span = 0 Hz		$\pm 0.01\%$ (nominal) $\pm 40\%$ (nominal) $\pm 0.01\%$ (nominal)
Sweep Trigger	Free Run, Line, Video, External 1, External 2, RF Burst, Periodic Timer	
Delayed Trigger <sup>a</sup>		
Range		
Span $\geq$ 10 Hz, swept	0 to 500 ms	
Span = 0 Hz or FFT	-150 ms to +500 ms	
Resolution	0.1 $\mu$ s	

a. Delayed trigger is available with line, video, RF burst and external triggers.

PXA Signal Analyzer  
Frequency and Time

Description	Specifications	Supplemental Information
<b>Triggers</b>		Additional information on some of the triggers and gate sources
<b>Video</b>		Independent of Display Scaling and Reference Level
Minimum settable level	–170 dBm	Useful range limited by noise
Maximum usable level		Highest allowed mixer level <sup>a</sup> + 2 dB (nominal)
Detector and Sweep Type relationships		
Sweep Type = Swept		
Detector = Normal, Peak, Sample or Negative Peak		Triggers on the signal before detection, which is similar to the displayed signal
Detector = Average		Triggers on the signal before detection, but with a single-pole filter added to give similar smoothing to that of the average detector
Sweep Type = FFT		Triggers on the signal envelope in a bandwidth wider than the FFT width
<b>RF Burst</b>		
Level Range		–40 to –10 dBm plus attenuation (nominal) <sup>b</sup>
Level Accuracy		
Absolute		±2 dB + Absolute Amplitude Accuracy (nominal)
Relative		±2 dB (nominal)
Bandwidth (–10 dB)		
Most cases <sup>c</sup>		>80 MHz (nominal)
Start Freq < 300 MHz, RF Burst Level Type = Absolute		
Sweep Type = Swept		16 MHz (nominal)
Sweep Type = FFT		
FFT Width > 25 MHz;		>80 MHz (nominal)
FFT Width 8 to 25 MHz;		30 MHz (nominal)
FFT Width < 8 MHz		16 MHz (nominal)
Frequency Limitations		If the start or center frequency is too close to zero, LO feedthrough can degrade or prevent triggering. How close is too close depends on the bandwidth listed above.
<b>External Triggers</b>		See <b>“Trigger Inputs” on page 84</b>
TV Triggers		Triggers on the leading edge of the selected sync pulse of standardized TV signals.

PXA Signal Analyzer  
Frequency and Time

Description	Specifications	Supplemental Information
Amplitude Requirements		-65 dBm minimum video carrier power at the input mixer, nominal
Compatible Standards	NTSC-M, NTSC-Japan, NTSC-4.43, PAL-M, PAL-N, PAL-N Combination, PAL-B/-D/-G/-H/-I. PAL-60, SECAM-L	
Field Selection	Entire Frame, Field One, Field Two	
Line Selection	1 to 525, or 1 to 625, standard dependent	

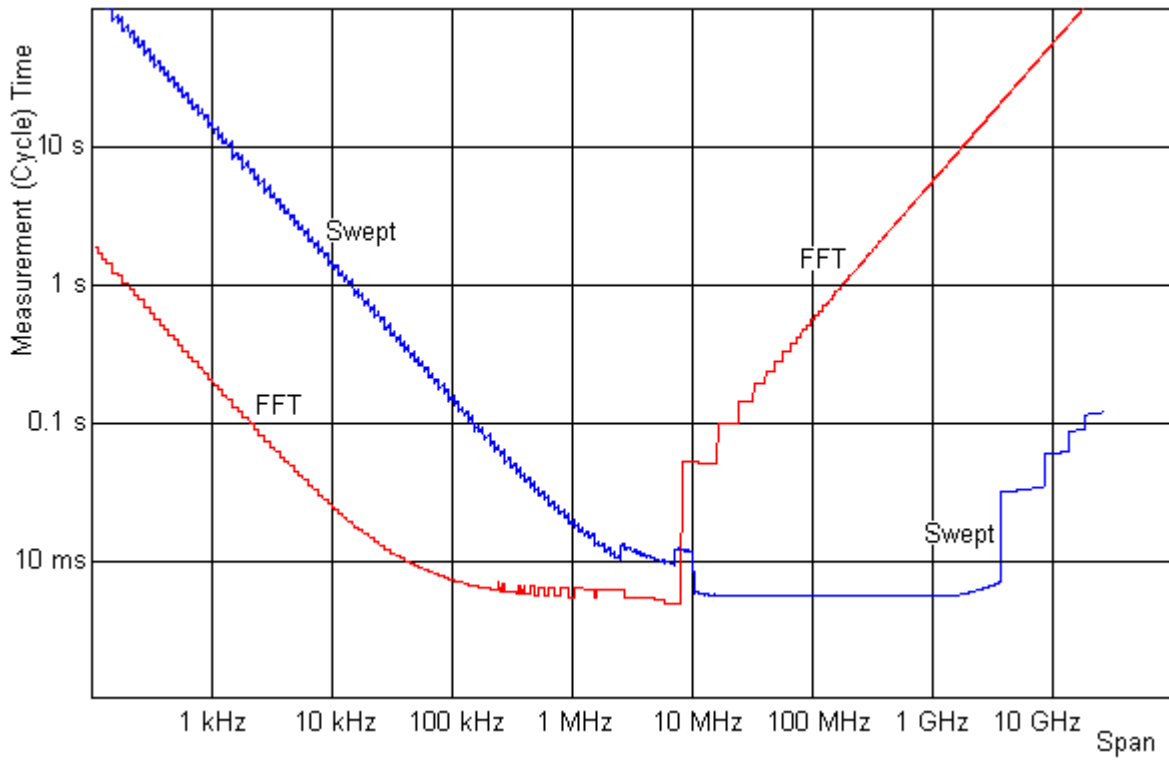

- The highest allowed mixer level depends on the IF Gain. It is nominally -10 dBm for Preamp Off and IF Gain = Low.
- Noise will limit trigger level range at high frequencies, such as above 15 GHz.
- Include RF Burst Level Type = Relative.

Description	Specifications	Supplemental Information
<b>Gated Sweep</b>		
Gate Methods	Gated LO Gated Video Gated FFT	
Span Range	Any span	
Gate Delay Range	0 to 100.0 s	
Gate Delay Settability	4 digits, $\geq 100$ ns	
Gate Delay Jitter		33.3 ns p-p (nominal)
Gate Length Range (Except Method = FFT)	1 $\mu$ s to 5.0 s	Gate length for the FFT method is fixed at 1.83/RBW, with nominally 2% tolerance.
Gated FFT and Gated Video Frequency and Amplitude Errors		Nominally no additional error for gated measurements when the Gate Delay is greater than the MIN FAST setting
Gated LO Frequency Errors		
Gate $\geq 10$ $\mu$ s		Nominally no additional error when the Gate Delay is greater than the MIN FAST setting
$1.0 \mu\text{s} \leq \text{Gate} < 10 \mu\text{s}$		Nominal error given by $100 \text{ ns} \times N \times (\text{Span}/\text{ST}) \times \sqrt{(\text{SpanPosition} \times \text{ST} / \text{GateLength})}$ ; see footnote <sup>a</sup>
Gated LO Amplitude Errors		Nominally no additional error when the Gate Delay is greater than the MIN FAST setting
Phase Noise Effects		Gated LO method overrides the loop configuration to force single loop in place of dual loop.
Gate Sources	External 1 External 2 Line RF Burst Periodic	Pos or neg edge triggered

- a. ST is sweep time; SpanPosition is the location of the on-screen signal, 0 being the left edge of the screen and 1 being the right edge. N is the harmonic mixing number.

Description	Specifications	Supplemental Information
<b>Number of Frequency Sweep Points (buckets)</b>		
Factory preset	1001	
Range	1 to 100,001	Zero and non-zero spans

Nominal Measurement Time vs. Span [Plot]

Description	Specifications	Supplemental Information
<b>Resolution Band width (RBW)</b>		
Range (–3.01 dB bandwidth)	1 Hz to 8 MHz Bandwidths above 3 MHz are 4, 5, 6, and 8 MHz. Bandwidths 1 Hz to 3 MHz are spaced at 10% spacing using the E24 series (24 per decade): 1.0, 1.1, 1.2, 1.3, 1.5, 1.6, 1.8, 2.0, 2.2, 2.4, 2.7, 3.0, 3.3, 3.6, 3.9, 4.3, 4.7, 5.1, 5.6, 6.2, 6.8, 7.5, 8.2, 9.1 in each decade.	
Power bandwidth accuracy <sup>a</sup>		
<b>RBW Range</b>	<b>CF Range</b>	
1 Hz to 100 kHz	All	±0.5% (0.022 dB)
110 kHz to 1.0 MHz	<3.6 GHz	±1.0% (0.044 dB)
1.1 to 2.0 MHz	<3.6 GHz	±0.07 dB (nominal)
2.2 to 3 MHz	<3.6 GHz	0 to –0.2 dB (nominal)
4 to 8 MHz	<3.6 GHz	0 to –0.4 dB (nominal)
Noise BW to RBW ratio <sup>b</sup>		1.056 ±2% (nominal)
Accuracy (–3.01 dB bandwidth) <sup>c</sup>		
1 Hz to 1.3 MHz RBW		±2% (nominal)
1.5 MHz to 3 MHz RBW		
CF ≤ 3.6 GHz		±7% (nominal)
CF > 3.6 GHz		±8% (nominal)
4 MHz to 8 MHz RBW		
CF ≤ 3.6 GHz		±15% (nominal)
CF > 3.6 GHz		±20% (nominal)
Selectivity (–60 dB/–3 dB)		4.1:1 (nominal)

- a. The noise marker, band power marker, channel power and ACP all compute their results using the power bandwidth of the RBW used for the measurement. Power bandwidth accuracy is the power uncertainty in the results of these measurements due only to bandwidth-related errors. (The analyzer knows this power bandwidth for each RBW with greater accuracy than the RBW width itself, and can therefore achieve lower errors.) The warranted specifications shown apply to the Gaussian RBW filters used in swept and zero span analysis. There are four different kinds of filters used in the spectrum analyzer: Swept Gaussian, Swept Flattop, FFT Gaussian and FFT Flattop. While the warranted performance only applies to the swept Gaussian filters, because only they are kept under statistical process control, the other filters nominally have the same performance.

PXA Signal Analyzer  
Frequency and Time

- b. The ratio of the noise bandwidth (also known as the power bandwidth) to the RBW has the nominal value and tolerance shown. The RBW can also be annotated by its noise bandwidth instead of this 3 dB bandwidth. The accuracy of this annotated value is similar to that shown in the power bandwidth accuracy specification.
- c. Resolution Bandwidth Accuracy can be observed at slower sweep times than auto-coupled conditions. Normal sweep rates cause the shape of the RBW filter displayed on the analyzer screen to widen by nominally 6%. This widening declines to 0.6% nominal when the Swp Time Rules key is set to Accuracy instead of Normal. The true bandwidth, which determines the response to impulsive signals and noise-like signals, is not affected by the sweep rate.

Description	Specification	Supplemental information
<b>Analysis Band width<sup>a</sup></b>		
Standard	10 MHz	
With <i>Option B25</i>	25 MHz	
With <i>Option B40</i>	40 MHz	
With <i>Option B85</i>	85 MHz	
With <i>Option B1X</i>	160/140 MHz <sup>b</sup>	

- a. Analysis bandwidth is the instantaneous bandwidth available about a center frequency over which the input signal can be digitized for further analysis or processing in the time, frequency, or modulation domain.
- b. Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.

Description	Specifications	Supplemental Information	
<b>Preselector Band width</b>		Relevant to many options, such as B1X Wide IF Bandwidth, in Bands 1 and higher. Nominal.	
Mean Bandwidth at CF <sup>a</sup>		Freq option ≤ 526	Freq option > 526
5 GHz		58 MHz	46 MHz
10 GHz		57 MHz	52 MHz
15 GHz		59 MHz	53 MHz
20 GHz		64 MHz	55 MHz
25 GHz		74 MHz	56 MHz
35 GHz			62 MHz
44 GHz			70 MHz
Standard Deviation		9%	7%
–3 dB Bandwidth		–7.5% relative to –4 dB bandwidth, nominal	

- a. The preselector can have a significant passband ripple. To avoid ambiguous results, the –4 dB bandwidth is characterized.

Description	Specifications	Supplemental Information
<b>Video Band width (VBW)</b>		
Range	Same as Resolution Bandwidth range plus wide-open VBW (labeled 50 MHz)	
Accuracy		$\pm 6\%$ (nominal) in swept mode and zero span <sup>a</sup>

- a. For FFT processing, the selected VBW is used to determine a number of averages for FFT results. That number is chosen to give roughly equivalent display smoothing to VBW filtering in a swept measurement. For example, if  $\text{VBW} = 0.1 \times \text{RBW}$ , four FFTs are averaged to generate one result.

## Amplitude Accuracy and Range

Description	Specifications	Supplemental Information
<b>Measurement Range</b>

- Signal frequencies above 18 GHz are prone to additional response errors due to modes in the Type-N connector used. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. The effect of these modes with this connector are included within these specifications.
- See the Electronic Attenuator (*Option EA3*) chapter for Frequency Response using the electronic attenuator.
- For Sweep Type = FFT, add the RF flatness errors of this table to the IF Frequency Response errors. An additional error source, the error in switching between swept and FFT sweep types, is nominally ±0.01 dB and is included within the “Absolute Amplitude Error” specifications.
- Specifications apply with DC coupling at all frequencies. With AC coupling, specifications apply at frequencies of 50 MHz and higher. Statistical observations at 10 MHz and lower show that most instruments meet the specification, but a few percent of instruments can be expected to have errors that, while within the specified limits, are closer to those limits than the measurement uncertainty guardband, and thus are not warranted. The AC coupling effect at 20 to 50 MHz is negligible, but not warranted.
- Band 0 is extendable (set “Extend Low Band” to On) to 3.7 GHz instead of 3.6 GHz in instruments with frequency option 508, 513 or 526 and serial number is equal with or greater than the following: US54490126, MY54490690, or SG54490127. Band 0 can also be extendable in earlier instruments with firmware of version A.16.13 or later and a field adjustment to perform that extension. Subject to these conditions, statistical observations show that performance nominally fits within the same range within the 3.6 to 3.7 GHz frequencies as within the next lower specified frequency range, but is not warranted.
- Specifications for frequencies > 3.5 GHz apply for sweep rates ≤100 MHz/ms.
- Preselector centering applied.

### Nominal Frequency Response Band 0 [Plot]

Description			Specifications	Supplemental Information		
<b>IF Frequency Response<sup>a</sup></b> (Demodulation and FFT response relative to the center frequency)				Freq Option 526 only: Modes above 18 GHz <sup>b</sup>		
Center Freq (GHz)	Span <sup>c</sup> (MHz)	Preselector	Max Error <sup>d</sup>	Mid width Error (95th Percentile)	Slope (dB/MHz) (95th Percentile)	RMS <sup>e</sup> (nominal)
<3.6	≤10		±0.20 dB	±0.12 dB	±0.10	0.02 dB
≥3.6, ≤26.5	≤10	On				0.23 dB
≥3.6, ≤26.5	≤10	Off <sup>f</sup>	±0.25 dB	±0.12 dB	±0.10	0.02 dB

>26.5, ≤50	≤10	Off <sup>f</sup>	±0.30 dB	±0.12 dB	±0.10	0.024 dB

a. The IF frequency response includes effects due to RF circuits such as input filters, that are a function of RF frequency, in addition to the IF passband effects.

PXA Signal Analyzer  
Amplitude Accuracy and Range

- b. Signal frequencies above 18 GHz are prone to additional response errors due to modes in the Type-N connector used. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. These modes cause nominally up to  $-0.35$  dB amplitude change, with phase errors of nominally up to  $\pm 1.2^\circ$ .
- c. This column applies to the instantaneous analysis bandwidth in use. In the Spectrum Analyzer Mode, this would be the FFT width.
- d. The maximum error at an offset (f) from the center of the FFT width is given by the expression  $\pm [\text{Midwidth Error} + (f \times \text{Slope})]$ , but never exceeds  $\pm \text{Max Error}$ . Here the Midwidth Error is the error at the center frequency for a given FFT span. Usually, the span is no larger than the FFT width in which case the center of the FFT width is the center frequency of the analyzer. When using the Spectrum Analyzer mode with an analyzer span is wider than the FFT width, the span is made up of multiple concatenated FFT results, and thus has multiple centers of FFT widths; in this case the f in the equation is the offset from the nearest center. Performance is nominally three times better at most center frequencies.
- e. The “rms” nominal performance is the standard deviation of the response relative to the center frequency, integrated across the span. This performance measure was observed at a center frequency in each harmonic mixing band, which is representative of all center frequencies; it is not the worst case frequency.
- f. *Option MPB* is installed and enabled.

Amplitude Accuracy and Range

Description	Specifications	Supplemental Information
<b>Absolute Amplitude Accuracy</b>		
At 50 MHz <sup>a</sup> 20 to 30°C Full temperature range	$\pm 0.24$ dB $\pm 0.28$ dB	$\pm 0.13$ dB (95th percentile)
At all frequencies <sup>a</sup> 20 to 30°C Full temperature range	$\pm(0.24 \text{ dB} + \text{frequency response})$ $\pm(0.28 \text{ dB} + \text{frequency response})$	
95th Percentile Absolute Amplitude Accuracy <sup>b</sup>  (Wide range of signal levels, RBWs, RLs, etc., 0.01 to 3.6 GHz, Atten = 10 dB)		$\pm 0.19$ dB
Amplitude Reference Accuracy		$\pm 0.05$ dB (nominal)
Preamp On <sup>c</sup> (P03, P08, P13, P26, P43, P44, P50)	$\pm(0.36 \text{ dB} + \text{frequency response})$	

- a. Absolute amplitude accuracy is the total of all amplitude measurement errors, and applies over the following subset of settings and conditions:  $1 \text{ Hz} \leq \text{RBW} \leq 1 \text{ MHz}$ ; Input signal  $-10$  to  $-50$  dBm (details below); Input attenuation 10 dB; span  $< 5 \text{ MHz}$  (nominal additional error for span  $\geq 5 \text{ MHz}$  is 0.02 dB); all settings auto-coupled except Swp Time Rules = Accuracy; combinations of low signal level and wide RBW use VBW  $\leq 30 \text{ kHz}$  to reduce noise. When using FFT sweeps, the signal must be at the center frequency.
- This absolute amplitude accuracy specification includes the sum of the following individual specifications under the conditions listed above: Scale Fidelity, Reference Level Accuracy, Display Scale Switching Uncertainty, Resolution Bandwidth Switching Uncertainty, 50 MHz Amplitude Reference Accuracy, and the accuracy with which the instrument aligns its internal gains to the 50 MHz Amplitude Reference.
- The only difference between signals within the range above  $-50$  dBm and those signals below that level is the scale fidelity. Our specifications and experience show no difference between signals above and below this level. The only reason our Absolute Amplitude Uncertainty specification does not go below this level is that noise detracts from our ability to verify the performance at all levels with acceptable test times and yields. So the performance is not warranted at lower levels, but we fully expect it to be the same.

PXA Signal Analyzer  
Amplitude Accuracy and Range

- b. Absolute Amplitude Accuracy for a wide range of signal and measurement settings, covers the 95th percentile proportion with 95% confidence. Here are the details of what is covered and how the computation is made: The wide range of conditions of RBW, signal level, VBW, reference level and display scale are discussed in footnote a. There are 44 quasi-random combinations used, tested at a 50 MHz signal frequency. We compute the 95th percentile proportion with 95% confidence for this set observed over a statistically significant number of instruments. Also, the frequency response relative to the 50 MHz response is characterized by varying the signal across a large number of quasi-random verification frequencies that are chosen to not correspond with the frequency response adjustment frequencies. We again compute the 95th percentile proportion with 95% confidence for this set observed over a statistically significant number of instruments. We also compute the 95th percentile accuracy of tracing the calibration of the 50 MHz absolute amplitude accuracy to a national standards organization. We also compute the 95th percentile accuracy of tracing the calibration of the relative frequency response to a national standards organization. We take the root-sum-square of these four independent Gaussian parameters. To that rss we add the environmental effects of temperature variations across the 20 to 30°C range. These computations and measurements are made with the mechanical attenuator only in circuit, set to the reference state of 10 dB.
- A similar process is used for computing the result when using the electronic attenuator under a wide range of settings: all even settings from 4 through 24 dB inclusive, with the mechanical attenuator set to 10 dB. The 95th percentile result was 0.21 dB.
- c. Same settings as footnote a, except that the signal level at the preamp input is –40 to –80 dBm. Total power at preamp (dBm) = total power at input (dBm) minus input attenuation (dB). This specification applies for signal frequencies above 100 kHz.

PXA Signal Analyzer  
Amplitude Accuracy and Range

Description	Specifications	Supplemental Information
<b>Display Scale Fidelity<sup>ab</sup></b> Absolute Log-Linear Fidelity (Relative to the reference condition: –25 dBm input through 10 dB attenuation, thus –35 dBm at the input mixer)  <b>Input mixer level<sup>c</sup></b> –18 dBm ≤ ML ≤ –10 dBm ML < –18 dBm  Relative Fidelity <sup>d</sup>  Sum of the following terms: high level term instability term slope term prefilter term	<b>Linearity</b>  ±0.10 dB ±0.07 dB	Typical  ±0.04 dB ±0.02 dB  Applies for mixer level <sup>c</sup> range from –10 to –80 dBm, mechanical attenuator only, preamp off, and dither on.  Nominal  Up to ±0.015 dB <sup>e</sup> 0.0019 dBrms <sup>f</sup> From equation <sup>g</sup> Up to ±0.005 dB <sup>h</sup>

- a. Supplemental information: The amplitude detection linearity specification applies at all levels below –10 dBm at the input mixer; however, noise will reduce the accuracy of low level measurements. The amplitude error due to noise is determined by the signal-to-noise ratio, S/N. If the S/N is large (20 dB or better), the amplitude error due to noise can be estimated from the equation below, given for the 3-sigma (three standard deviations) level.

$$3\sigma = 3(20dB)\log \langle 1 + 10^{-((S/N + 3dB)/20dB)} \rangle$$

The errors due to S/N ratio can be further reduced by averaging results. For large S/N (20 dB or better), the 3-sigma level can be reduced proportional to the square root of the number of averages taken.

- b. The scale fidelity is warranted with ADC dither set to Medium. Dither increases the noise level by nominally only 0.28 dB for the most sensitive case (preamp Off, best DANL frequencies). With dither Off, scale fidelity for low level signals, around –60 dBm or lower, will nominally degrade by 0.2 dB. Dither High will give exceptional linear relative scale fidelity, but increase DANL by 0.63 dB instead of 0.28 dB.
- c. Mixer level = Input Level – Input Attenuation
- d. The relative fidelity is the error in the measured difference between two signal levels. It is so small in many cases that it cannot be verified without being dominated by measurement uncertainty of the verification. Because of this verification difficulty, this specification gives nominal performance, based on numbers that are as conservatively determined as those used in warranted specifications. We will consider one example of the use of the error equation to compute the nominal performance.

Example: the accuracy of the relative level of a sideband around –60 dBm, with a carrier at –5 dBm, using attenuation = 10 dB, RBW = 3 kHz, evaluated with swept analysis. The high level term is evaluated with P1 = –15 dBm and P2 = –70 dBm at the mixer. This gives a maximum error within ±0.008 dB. The instability term is ±0.0019 dB if the measurement is completed within a minute. The slope term evaluates to ±0.022 dB. The prefilter term applies and evaluates to the limit of ±0.005 dB. The sum of all these terms is ±0.037 dB.

PXA Signal Analyzer  
Amplitude Accuracy and Range

- e. Errors at high mixer levels will nominally be well within the range of  $\pm 0.015 \text{ dB} \times \{\exp[(P1 - Pref)/(8.69 \text{ dB})] - \exp[(P2 - Pref)/(8.69 \text{ dB})]\}$  (exp is the natural exponent function,  $e^x$ ). In this expression, P1 and P2 are the powers of the two signals, in decibel units, whose relative power is being measured. Pref is  $-10 \text{ dBm}$  ( $-10 \text{ dBm}$  is the highest power for which linearity is specified). All these levels are referred to the mixer level.
- f. The stability of the analyzer gain can be an error term of importance when no settings have changed. These have been studied carefully in the PXA. One source of instability is the variation in analyzer response with time when fully warmed up in a stable lab environment. This has been observed to be well modeled as a random walk process, where the difference in two measurements spaced by time  $t$  is given by  $a \times \sqrt{t}$ , where  $a$  is  $0.0019 \text{ dBrms}$  per root minute. The other source of instability is updated alignments from running full or partial alignments in the background or invoking an alignment. Invoked alignments (Align Now, All) have a standard deviation of  $0.0018 \text{ dB}$ , and performing these will restart the random walk behavior. Partial alignments (Auto Align set to "Partial") have a standard deviation that is, coincidentally, also  $0.0018 \text{ dBrms}$ , and only occurs once every ten minutes. The standard deviation from full background alignment (Auto Align set to "Normal") is  $0.015 \text{ dBrms}$ ; with these alignments on, there is no additional random walk behavior. (Keysight recommends setting alignments (Auto Align) to Normal in order to make the best measurements over long periods of time or in environments without very high temperature stability. For short term measurements in highly stable environments, setting alignments to Partial can give the best stability. Setting Alignments to Off is not recommended where stability matters.)
- g. Slope error will nominally be well within the range of  $\pm 0.0004 \times (P1 - P2)$ . P1 and P2 are defined in footnote e.
- h. A small additional error is possible. In FFT sweeps, this error is possible for spans under  $4.01 \text{ kHz}$ . For non-FFT measurements, it is possible for RBWs of  $3.9 \text{ kHz}$  or less. The error is well within the range of  $\pm 0.0021 \times (P1 - P2)$  subject to a maximum of  $\pm 0.005 \text{ dB}$ . (The maximum dominates for all but very small differences.) P1 and P2 are defined in footnote e.

<b>Swept<sup>f</sup>, RBW =</b>	<b>FFT Width =</b>		<b>(nominal)</b>
≤3.9 kHz	<4.01 kHz		8.9 kHz
4.3 to 27 kHz	<28.81 kHz		79 kHz
30 to 160 kHz	<167.4 kHz		303 kHz
180 to 390 kHz	<411.9 kHz		966 kHz
430 kHz to 8 MHz	<7.99 MHz		10.9 MHz

- a. Large signals, even at frequencies not shown on the screen, can cause the analyzer to incorrectly measure on-screen signals because of two-tone gain compression. This specification tells how large an interfering signal must be in order to cause a 1 dB change in an on-screen signal.
- b. Specified at 1 kHz RBW with 100 kHz tone spacing. The compression point will nominally equal the specification for tone spacing greater than 5 times the prefilter bandwidth. At smaller spacings, ADC clipping may occur at a level lower than the 1 dB compression point.

- c. Reference level and off-screen performance: The reference level (RL) behavior differs from some earlier analyzers in a way that makes this analyzer more flexible. In other analyzers, the RL controlled how the measurement was performed as well as how it was displayed. Because the logarithmic amplifier in these analyzers had both range and resolution limitations, this behavior was necessary for optimum measurement accuracy. The logarithmic amplifier in this signal analyzer, however, is implemented digitally such that the range and resolution greatly exceed other instrument limitations. Because of this, the analyzer can make measurements largely independent of the setting of the RL without compromising accuracy. Because the RL becomes a display function, not a measurement function, a marker can read out results that are off-screen, either above or below, without any change in accuracy. The only exception to the independence of RL and the way in which the measurement is performed is in the input attenuation setting: When the input attenuation is set to auto, the rules for the determination of the input attenuation include dependence on the reference level. Because the input attenuation setting controls the tradeoff between large signal behaviors (third-order intermodulation, compression, and display scale fidelity) and small signal effects (noise), the measurement results can change with RL changes when the input attenuation is set to auto.
- d. Mixer power level (dBm) = input power (dBm) – input attenuation (dB).
- e. The ADC clipping level declines at low frequencies (below 50 MHz) when the LO feedthrough (the signal that appears at 0 Hz) is within 5 times the prefilter bandwidth (see table) and must be handled by the ADC. For example, with a 300 kHz RBW and prefilter bandwidth at 966 kHz, the clipping level reduces for signal frequencies below 4.83 MHz. For signal frequencies below 2.5 times the prefilter bandwidth, there will be additional reduction due to the presence of the image signal (the signal that appears at the negative of the input signal frequency) at the ADC.
- f. This table applies without *Option FS1*, fast sweep. With *Option FS1*, this table applies for sweep rates that are manually chosen to be the same as or slower than "traditional" sweep rates, instead of the much faster sweep rates, such as autocoupled sweep rates, available with FS1. Sweep rate is defined to be span divided by sweep time. If the sweep rate is  $\leq 1.1$  times RBW-squared, the table applies. Otherwise, compute an "effective RBW" = Span / (SweepTime  $\times$  RBW). To determine the IF Prefilter Bandwidth, look up this effective RBW in the table instead of the actual RBW. For example, for RBW = 3 kHz, Span = 300 kHz, and Sweep time = 42 ms, we compute that Sweep Rate = 7.1 MHz/s, while RBW-squared is 9 MHz/s. So the Sweep Rate is  $< 1.1$  times RBW-squared and the table applies; row 1 shows the IF Prefilter Bandwidth is nominally 8.9 kHz. If the sweep time is 1 ms, then the effective RBW computes to 100 kHz. This would result in an IF Prefilter Bandwidth from the third row, nominally 303 kHz.

## PXA Signal Analyzer

### Dynamic Range

- a. DANL for zero span and swept is measured in a 1 kHz RBW and normalized to the narrowest available RBW, because the noise figure does not depend on RBW and 1 kHz measurements are faster.
- b. Specifications marked with an x in this column apply to analyzers with mmW frequency options (*Option 543, 544 or 550*) and none of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- c. Specifications marked with an x in this column apply to analyzers with mmW frequency options (*Option 543, 544 or 550*) and one or more of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- d. DANL below 10 MHz is affected by phase noise around the LO feedthrough signal. Specifications apply with the best setting of the Phase Noise Optimization control, which is to choose the "Best Close-in  $\phi$  Noise" for frequencies below about 150 kHz, and "Best Wide Offset  $\phi$  Noise" for frequencies above about 150 kHz.
- e. Band 0 is extendable (set "Extend Low Band" to On) to 3.7 GHz instead of 3.6 GHz in instruments with frequency option 508, 513 or 526 and serial number is equal with or greater than the following: US54490126, MY54490690, or SG54490127. Band 0 can also be extendable in earlier instruments with firmware of version A.16.13 or later and a field adjustment to perform that extension. Subject to these conditions, statistical observations show that performance nominally fits within the same range within the 3.6 to 3.7 GHz frequencies as within the next lower specified frequency range, but is not warranted.
- f. Setting the IF Gain to Low is often desirable in order to allow higher power into the mixer without overload, better compression and better third-order intermodulation. When the Swept IF Gain is set to Low, either by auto coupling or manual coupling, there is noise added above that specified in this table for the IF Gain = High case. That excess noise appears as an additional noise at the input mixer. This level has sub-decibel dependence on center frequency. To find the total displayed average noise at the mixer for Swept IF Gain = Low, sum the powers of the DANL for IF Gain = High with this additional DANL. To do that summation, compute  $\text{DANL}_{\text{total}} = 10 \times \log(10(\text{DANL}_{\text{high}}/10) + 10(\text{AdditionalDANL} / 10))$ . In FFT sweeps, the same behavior occurs, except that FFT IF Gain can be set to autorange, where it varies with the input signal level, in addition to forced High and Low settings.

- a. This statement on the improvement in DANL is based on the accuracy of the fit of the noise floor model to the measured values of that noise. This measure of the performance correlates well with improvement versus frequency. The improvement actually measured and specified in "Examples of Effective DANL" usually meet these limits as well, but not with the confidence in some cases.

## PXA Signal Analyzer Dynamic Range

- b. The specifications shown in this table apply to the instruments with N9030A-NF2 (Noise floor extensions, instrument alignment). The N9030A-NF2 ships standard with all PXAs beginning approximately January 2015. The earlier PXAs that shipped standard with NFE (Noise floor extension, factory calibration) can be upgraded with *Option N9030AK-NF2* to achieve performance indicated here. Press System > Show > System to ensure the N9030A-NF2 is licensed. If the N9030A-NF2 is not licensed, then refer to the chapter of *Version Dependent Backdated Specifications* at the end of this book for the DANL with NFE specifications.
- c. Specifications marked with an x in this column apply to analyzers with mmW frequency options (*Option 543, 544 or 550*) and none of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- d. Specifications marked with an x in this column apply to analyzers with mmW frequency options (*Option 543, 544 or 550*) and one or more of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- e. DANL of the preamp is specified with a 50 $\Omega$  source impedance. Like all amplifiers, the noise varies with the source impedance. When NFE compensates for the noise with an ideal source impedance, the variation in the remaining noise level with the actual source impedance is greatly multiplied in a decibel sense.
- f. NFE does not apply to the low frequency sensitivity. At frequencies below about 0.5 MHz, the sensitivity is dominated by phase noise surrounding the LO feedthrough. The NFE is not designed to improve that performance. At frequencies between 0.5 and 20 MHz the NFE effectiveness increases from nearly none to near its maximum.
- g. Improvement in the uncertainty of measurement due to amplitude errors and variance of the results is modestly improved by using NFE. The nominal improvement shown was evaluated for a 2 dB error with 250 traces averaged. For extreme numbers of averages, the result will be as shown in the "Improvement for Noise-like Signals" and "Examples" sections of this table.
- h. Pulsed-RF signals are usually measured with peak detection. Often, they are also measured with many "max hold" traces. When the measurement time in each display point is long compared to the reciprocal of the RBW, or the number of traces max held is large, considerable variance reduction occurs in each measurement point. When the variance reduction is large, NFE can be quite effective; when it is small, NFE has low effectiveness. For example, in Band 0 with 100 pulses per trace element, in order to keep the error within  $\pm 3$  dB error 95% of the time, the signal can be 10.8 dB lower with NFE than without NFE.
- i. The noise is evaluated only at a frequency given by the center of the band plus pi times 1 MHz. (We use an irrational offset from exactly midband to reduce the risk of uncovering residual responses at round-numbered frequencies, such as integer multiples of the 10 MHz reference frequency.) The center of the band is chosen because it is a highly representative frequency in the band. It is not worst-case, and usually better than the average case.
- j. "Effective DANL" is the DANL which would give equivalent amplitude errors to those observed with a signal about 4 dB above the uncompensated noise floor. Effective DANL can be a positive or negative amount of power; the expressed specifications are of the absolute value of that Effective DANL. Effective DANL is verified with measurement settings that are best for low level measurements, which is with the average detector, with Average Type = Power, and very large amounts of averaging.

## Spurious Responses

Description		Specifications			Supplemental Information

44 to 50 GHz	f+645 MHz	–30 dBm			–65 dBc (nominal)	–75 dBc (nominal)
Other Spurious Responses						
Carrier Frequency $\leq 26.5$ GHz						
First RF Order <sup>g</sup> (f $\geq 10$ MHz from carrier)		–10 dBm	–80 dBc + $20 \times \log(N^h)$		Includes IF feedthrough, LO harmonic mixing responses	
Higher RF Order <sup>i</sup> (f $\geq 10$ MHz from carrier)		–40 dBm	–80 dBc + $20 \times \log(N^h)$		Includes higher order mixer responses	

PXA Signal Analyzer  
Dynamic Range

Description	Specifications	Supplemental Information
Carrier Frequency >26.5 GHz		
First RF Order <sup>d</sup> (f ≥ 10 MHz from carrier)	–30 dBm	–90 dBc (nominal)
Higher RF Order <sup>f</sup> (f ≥ 10 MHz from carrier)	–30 dBm	–90 dBc (nominal)
LO-Related Spurious Responses (Offset from carrier 200 Hz to 10 MHz)	–10 dBm $-68 \text{ dBc}^{\text{f}} + 20 \times \log(\text{N}^{\text{h}})$	$-72 \text{ dBc} + 20 \times \log(\text{N}^{\text{h}})$ (typical)
Line-Related Spurious Responses		$-73 \text{ dBc}^{\text{j}} + 20 \times \log(\text{N}^{\text{h}})$ (nominal)

- The spurious response specifications only apply with the preamp turned off. When the preamp is turned on, performance is nominally the same as long as the mixer level is interpreted to be: Mixer Level = Input Level – Input Attenuation + Preamp Gain
- Input terminated, 0 dB input attenuation.
- Mixer Level = Input Level – Input Attenuation.
- The values in this column are for RF/μW PXA (*Options 503, 508, 513, or 526*) or mmW PXA (*Options 543, 544, or 550*) with serial number prefix <MY/SG/US5135.
- The values in this column are for mmW PXA (*Options 543, 544, or 550*) with serial number prefix ≥MY/SG/US5135.
- We also support the following additional spurious responses specifications from 8 to 12 GHz at 20 to 30° C. Image responses are warranted to be better than –82 dBc, with 95th percentile performance of –88.3 dBc. LO-related spurious responses are warranted to be better than –83 dBc at 1 to 10 MHz offsets from the carrier, with phase noise optimization set to Best Wide-Offset.
- With first RF order spurious products, the indicated frequency will change at the same rate as the input, with higher order, the indicated frequency will change at a rate faster than the input.
- N is the LO multiplication factor.
- RBW=100 Hz. With higher RF order spurious responses, the observed frequency will change at a rate faster than the input frequency.
- Nominally –40 dBc under large magnetic (0.38 Gauss rms) or vibrational (0.21 g rms) environmental stimuli.

## Second Harmonic Distortion

Description			Specifications			Supplemental Information				
Second Harmonic Distortion			<div>Mixer Level<sup>a</sup></div> <div>Distortion</div> <div>SHI<sup>bc</sup></div>			<div>Distortion (nominal)</div>	<div>SHI<sup>bc</sup> (nominal)</div>			
mmW (Option 543, 544, or 550)										
RF/μW (Option 503, 508, 513, or 526)										
Source Frequency										
0 to 100 MHz	x	x						-15 dBm	-57 dBc	+42 dBm
0.1 to 1.8 GHz <sup>d</sup>	x	x						-15 dBm	-60 dBc	+45 dBm
1.75 <sup>d</sup> to 3 GHz	x							-15 dBm	-77 dBc	+62 dBm
1.75 to 3 GHz		x						-15 dBm	-72 dBc	+57 dBm
3 to 6.5 GHz	x	x						-15 dBm	-77 dBc	+62 dBm
6.5 to 10 GHz	x	x						-15 dBm	-70 dBc	+55 dBm
10 to 13.25 GHz	x	x	-15 dBm	-62 dBc	+47 dBm					
13.2 to 25 GHz		x	-15 dBm			-65 dBc	+50 dBm			

a. Mixer level = Input Level – Input Attenuation

b. SHI = second harmonic intercept. The SHI is given by the mixer power in dBm minus the second harmonic distortion level relative to the mixer tone in dBc.

c. Performance >3.6 GHz improves greatly with *Option LNP* enabled. See **“Option LNP - Low Noise Path Specifications” on page 195**.

d. These frequencies are half of the band edge frequencies. See **Band Overlaps on page 20**.

17.0 to 26.5 GHz <sup>f</sup>	x			+14 dBm	
17.0 to 26.5 GHz <sup>f</sup>		x		+10 dBm	
17.0 to 26.5 GHz <sup>f</sup>			x	+9 dBm	

- See the IF Prefilter Bandwidth table in the Gain Compression specifications on [page 47](#). When the tone separation condition is met, the effect on TOI of the setting of IF Gain is negligible. TOI is verified with IF Gain set to its best case condition, which is IF Gain = Low.
- TOI is verified with two tones, each at  $-16$  dBm at the mixer, spaced by 100 kHz.
- Traditionally, the distortion components from two tones, each at  $-30$  dBm, were given as specifications. When spectrum analyzers were not as good as they are now, these distortion products were easily measured. As spectrum analyzers improved, the measurement began to be made at higher levels and extrapolated to the industry-standard  $-30$  dBm test level. This extrapolation was justified by excellent conformance with the third-order model, wherein distortion in dBc was given by twice the difference between the test tone level and the intercept, both given in dBm units. In PXA, we no longer make that extrapolation in this Specifications Guide.  
One reason we don't extrapolate is that the model does not work as well as it had with higher levels of distortion in older and less capable analyzers, so that the computation is misleading; distortions at low test levels will be modestly higher than predicted from the formula. The second reason is that the distortion components are so small as to be unmeasurable, and thus highly irrelevant, in many cases.  
Please note the curvature of the third-order intermodulation line in the 1 GHz graph that follows, which is representative of performance below 3.6 GHz.
- Intercept = TOI = third order intercept. The TOI is given by the mixer tone level (in dBm) minus (distortion/2) where distortion is the relative level of the distortion tones in dBc.
- Band 0 is extendable (set "Extend Low Band" to On) to 3.7 GHz instead of 3.6 GHz in instruments with frequency option 508, 513 or 526 and serial number is equal with or greater than the following: US54490126, MY54490690, or SG54490127. Band 0 can also be extendable in earlier instruments with firmware of version A.16.13 or later and a field adjustment to perform that extension. Subject to these conditions, statistical observations show that performance nominally fits within the same range within the 3.6 to 3.7 GHz frequencies as within the next lower specified frequency range, but is not warranted.

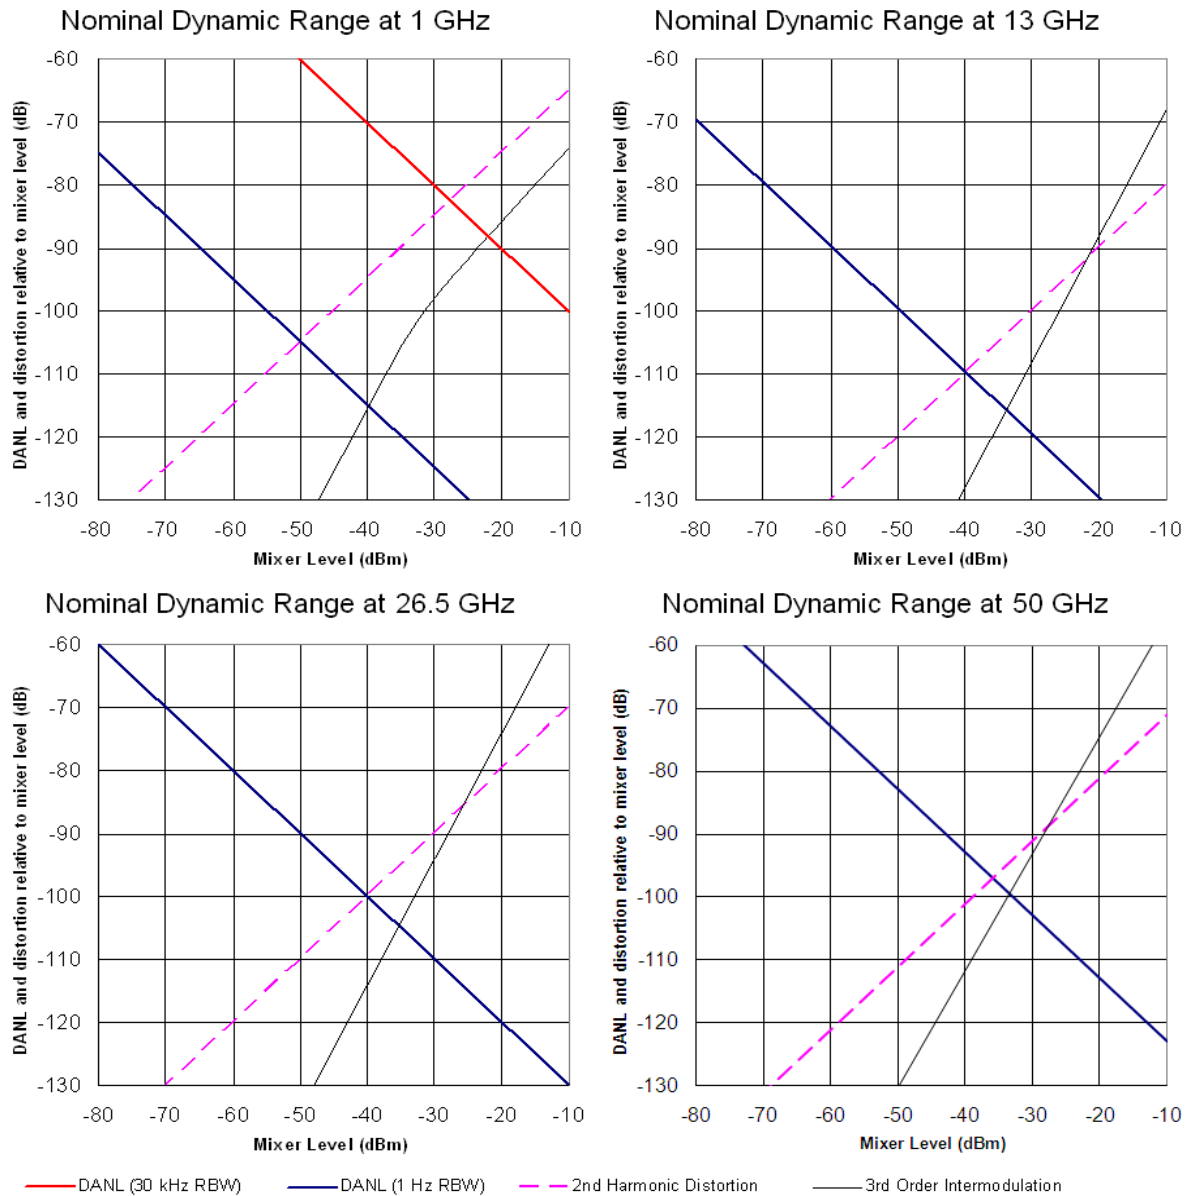

## PXA Signal Analyzer Dynamic Range

- f. Intercept performance is nominally 3 dB better in this band in those analyzers which have either *Option LNP* or *Option MPB* installed, or both, when these options are not in use.

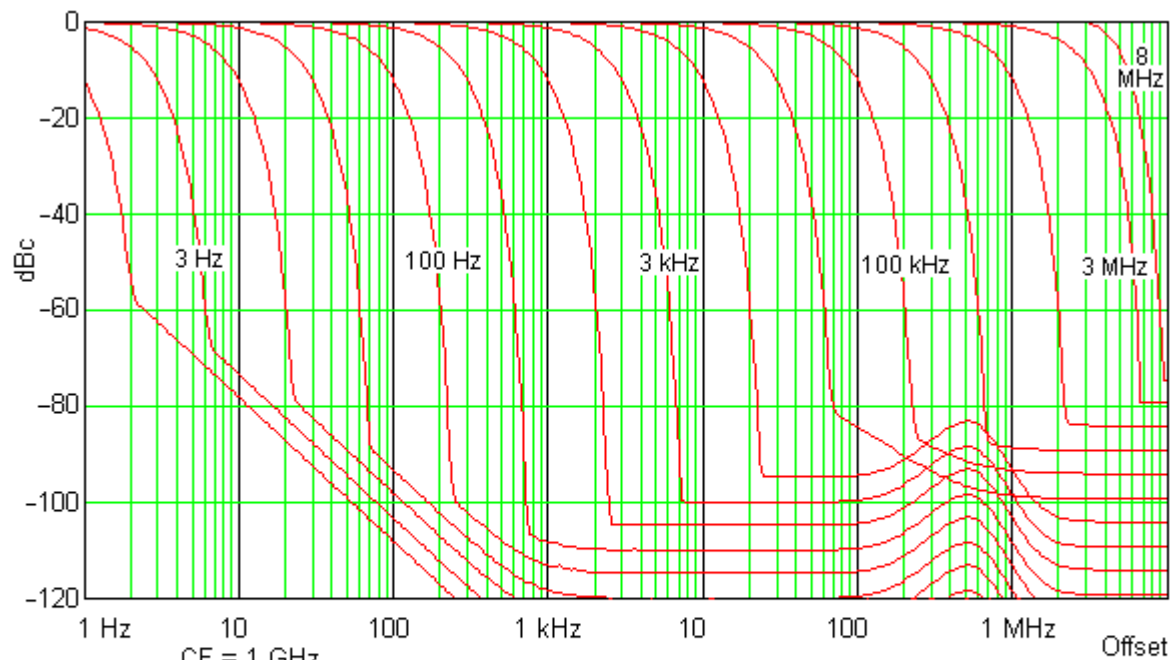

Nominal TOI vs. Input Frequency and Tone Separation [Plot]

### Nominal Dynamic Range [Plot]

Nominal Dynamic Range vs. Offset Frequency vs. RBW [Plot]

Conditions:

- CF = 1 GHz
- Mixer Level = -10 dBm
- Only members of the 1/3/10 sequence of the 24/decade RBWs are shown
- RBWs 10 kHz and below are shown with phase noise optimized for close-in offsets
- RBWs 30 kHz and above are shown with phase noise optimized for wide offsets
- Average Type = Log
- Noise Floor Extension = Off

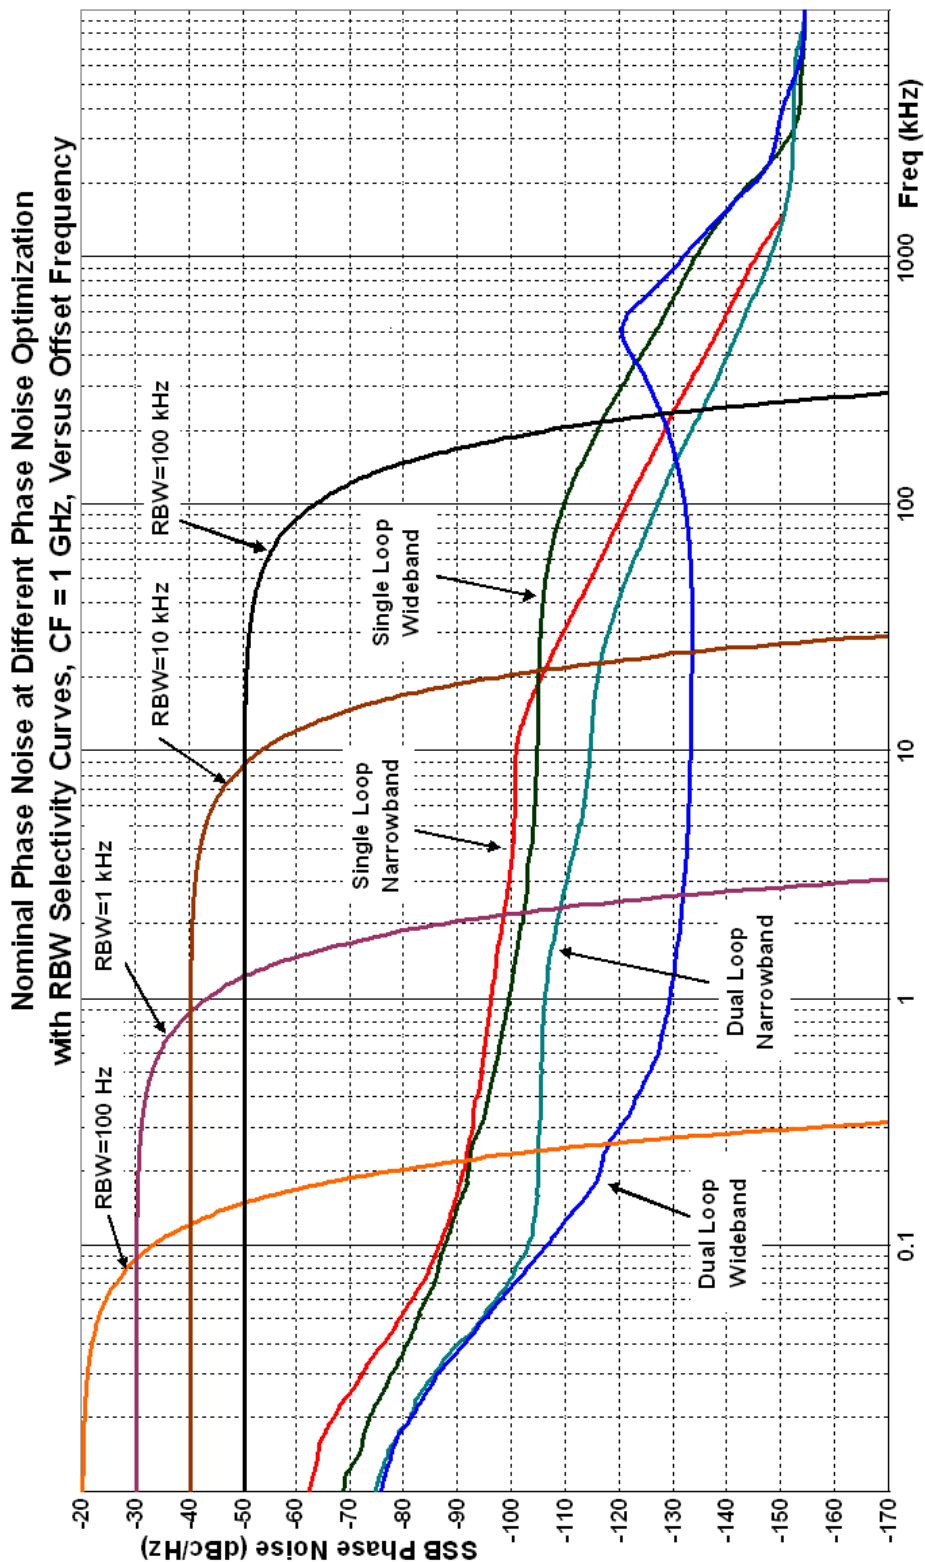

## Phase Noise

Description	Specifications		Supplemental Information
<b>Phase Noise</b>  (Center Frequency = 1 GHz <sup>a</sup> Best-case Optimization <sup>b</sup> Internal Reference <sup>c</sup> )			Noise Sidebands
Offset Frequency	<b>20 to 30°C</b>	<b>Full range</b>	
10 Hz			–80 dBc/Hz (nominal) <sup>d</sup>
100 Hz	–94 dBc/Hz	–92 dBc/Hz	–100 dBc/Hz (typical)
1 kHz	–121 dBc/Hz	–118 dBc/Hz	–125 dBc/Hz (typical)
10 kHz	–129 dBc/Hz	–128 dBc/Hz	–132 dBc/Hz (typical)
30 kHz	–130 dBc/Hz	–129 dBc/Hz	–132 dBc/Hz (typical)
100 kHz	–129 dBc/Hz	–128 dBc/Hz	–131 dBc/Hz (typical)
1 MHz <sup>e</sup>	–145 dBc/Hz	–144 dBc/Hz	–146 dBc/Hz (typical)
10 MHz <sup>e</sup>	–155 dBc/Hz	–154 dBc/Hz	–158 dBc/Hz (typical)

- The nominal performance of the phase noise at center frequencies different than the one at which the specifications apply (1 GHz) depends on the center frequency, band and the offset. For low offset frequencies, offsets well under 100 Hz, the phase noise increases by  $20 \times \log[(f + 0.3225)/1.3225]$ . For mid-offset frequencies such as 50 kHz, phase noise trends as  $20 \times \log[(f + 5.1225)/6.1225]$ , and also varies chaotically an additional nominally  $\pm 2$  dB versus the center frequency. For wide offset frequencies, offsets above about 500 kHz, phase noise increases as  $20 \times \log(N)$ . N is the LO Multiple as shown on [page 20](#); f is in GHz units in all these relationships; all increases are in units of decibels.
- Noise sidebands for lower offset frequencies, for example, 10 kHz, apply with the phase noise optimization (PhNoise Opt) set to Best Close-in  $\phi$  Noise. Noise sidebands for higher offset frequencies, for example, 1 MHz, as shown apply with the phase noise optimization set to Best Wide-offset  $\phi$  Noise.
- Specifications are given with the internal frequency reference. The phase noise at offsets below 100 Hz is impacted or dominated by noise from the reference. Thus, performance with external references will not follow the curves and specifications. When using an external reference with superior phase noise, we recommend setting the external reference phase-locked-loop bandwidth to wide (60 Hz), to take advantage of that superior performance. When using an external reference with inferior phase noise performance, we recommend setting that bandwidth to narrow (15 Hz). In these relationships, inferior and superior phase noise are with respect to –134 dBc/Hz at 30 Hz offset from a 10 MHz reference. Because most reference sources have phase noise behavior that falls off at a rate of 30 dB/decade, this is usually equivalent to –120 dBc/Hz at 10 Hz offset. For more information, see Phase Noise Effects, Ext Ref vs. Loop BW [Plot] on [page 67](#).
- Nominal phase noise was –75 dBc/Hz for instruments produced before approximately September 1, 2012.

- e. Analyzer-contributed phase noise at the low levels of this offset requires advanced verification techniques because broadband noise would otherwise cause excessive measurement error. Keysight uses a high level low phase noise CW test signal and sets the input attenuator so that the mixer level will be well above the normal top-of-screen level (-10 dBm) but still well below the 1 dB compression level. This improves dynamic range (carrier to broadband noise ratio) at the expense of amplitude uncertainty due to compression of the phase noise sidebands of the analyzer. (If the mixer level were increased to the "1 dB Gain Compression Point," the compression of a single sideband is specified to be 1 dB or lower. At lower levels, the compression falls off rapidly. The compression of phase noise sidebands is substantially less than the compression of a single-sideband test signal, further reducing the uncertainty of this technique.) Keysight also measures the broadband noise of the analyzer without the CW signal and subtracts its power from the measured phase noise power. The same techniques of overdrive and noise subtraction can be used in measuring a DUT, of course.

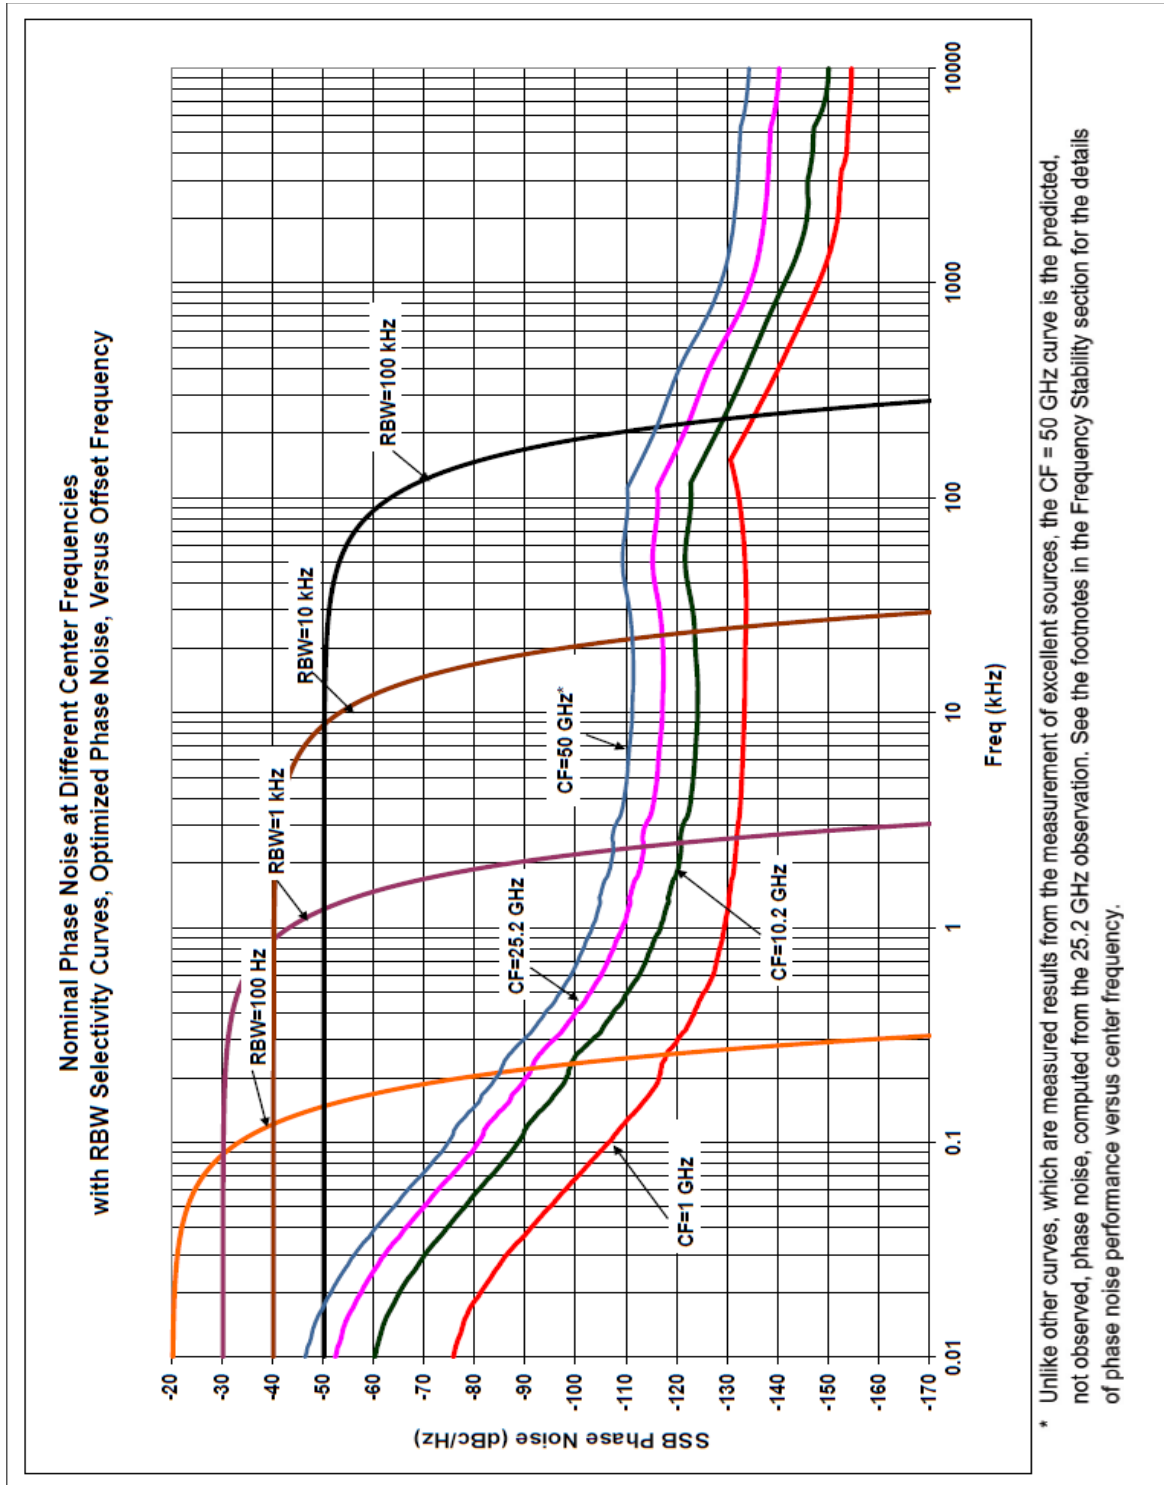

Nominal Phase Noise of Different LO Optimizations [Plot]

				Single Loop Wideband	

Relationship between user interface  
settings and loop configuration

Nominal Phase Noise at Different Center Frequencies [Plot]

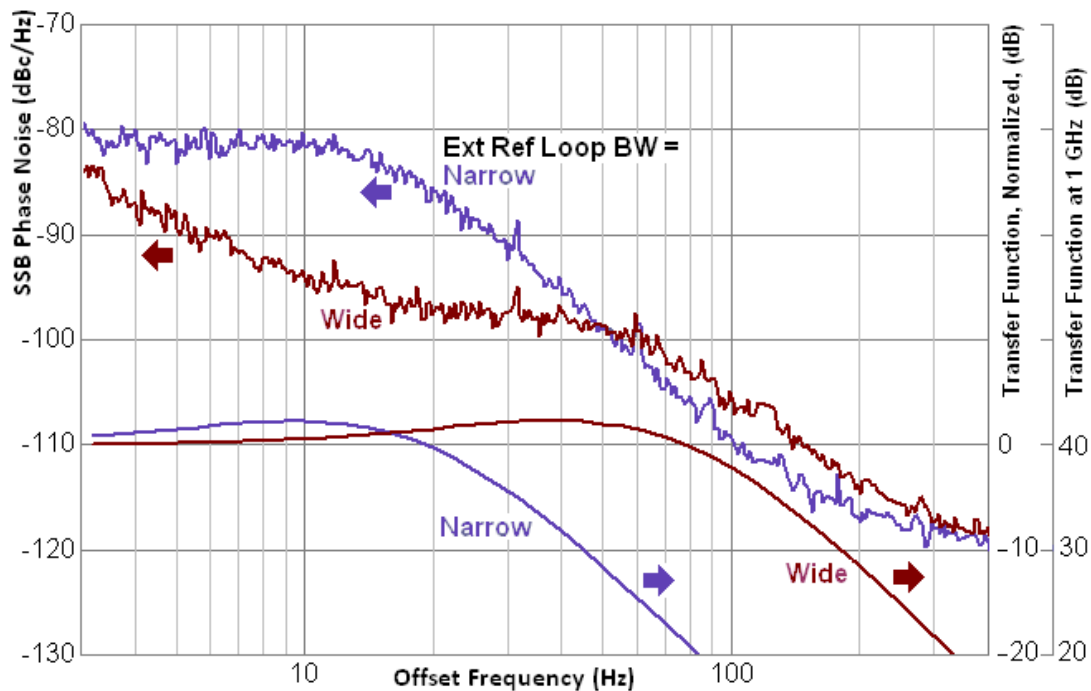

### Phase Noise Effects, Ext Ref vs. Loop BW [Plot]

The effect of the Ext Ref Loop BW control (Narrow and Wide) is shown in this graphic. When set to Wide, the noise from the internal circuitry is reduced, but noise in the external reference is subject to being impressed on the LO through the transfer function shown in the smooth curve labeled "Wide." For an excellent reference, this can give lower overall noise. When the Narrow selection is made, the internal noise effect is higher, but external reference noise above 20 Hz is rejected.

The noise curves were measured at 1 GHz center frequency with an excellent reference and excellent RF signal, and is thus a conservative estimate of the residual noise of the PXA circuitry. At that center frequency, the transfer function curves approach 40 dB gain to phase noise at low offset frequencies for a 10 MHz external reference. (This 40 dB is computed as  $20 \times \log_{10} 10^{(f_C/f_{REF})}$ ). The measured noise curves will scale with frequency the same way.)

Example: Consider an external reference at 10 MHz with phase noise of  $-135$  dBc/Hz at 20 Hz offset. If the Narrow setting is chosen, the analyzer noise density will be  $-86$  dBc/Hz at 20 Hz offset, the gain to the reference will be 40 dB, giving  $-95$  dBc/Hz contribution. Add these together on a power scale as  $10 \times \log_{10} (10^{(-86/10)} + 10^{(-95/10)}) = -85.5$  dBc/Hz. If Wide is chosen, the analyzer noise density will be  $-97$  dBc/Hz at 20 Hz offset, the gain to the reference will be 42 dB, giving  $-93$  dBc/Hz contribution. Add those together on a power scale as  $10 \times \log_{10} (10^{(-97/10)} + 10^{(-93/10)}) = -91.5$  dBc/Hz. "Wide" will give a 6 dB superior result to the Narrow selection.

## Power Suite Measurements

The specifications for this section apply only to instruments with Frequency *Option 503, 508, 513, or 526*. For instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specification in this chapter.

- a. The effect of scale fidelity on the ratio of two powers is called the relative scale fidelity. The scale fidelity specified in the Amplitude section is an absolute scale fidelity with –35 dBm at the input mixer as the reference point. The relative scale fidelity is nominally only 0.01 dB larger than the absolute scale fidelity.
- b. See Amplitude Accuracy and Range section.
- c. See Frequency and Time section.
- d. Expressed in decibels.
- e. An ACP measurement measures the power in adjacent channels. The shape of the response versus frequency of those adjacent channels is occasionally critical. One parameter of the shape is its 3 dB bandwidth. When the bandwidth (called the Ref BW) of the adjacent channel is set, it is the 3 dB bandwidth that is set. The passband response is given by the convolution of two functions: a rectangle of width equal to Ref BW and the power response versus frequency of the RBW filter used. Measurements and specifications of analog radio ACPs are often based on defined bandwidths of measuring receivers, and these are defined by their –6 dB widths, not their –3 dB widths. To achieve a passband whose –6 dB width is x, set the Ref BW to be  $x - 0.572 \times \text{RBW}$ .
- f. Most versions of adjacent channel power measurements use negative numbers, in units of dBc, to refer to the power in an adjacent channel relative to the power in a main channel, in accordance with ITU standards. The standards for W-CDMA analysis include ACLR, a positive number represented in dB units. In order to be consistent with other kinds of ACP measurements, this measurement and its specifications will use negative dBc results, and refer to them as ACPR, instead of positive dB results referred to as ACLR. The ACLR can be determined from the ACPR reported by merely reversing the sign.
- g. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately  $-37 \text{ dBm} - (\text{ACPR}/3)$ , where the ACPR is given in (negative) decibels.
- h. To meet this specified accuracy when measuring mobile station (MS) or user equipment (UE) within 3 dB of the required –33 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –22 dBm, so the input attenuation must be set as close as possible to the average input power – (–22 dBm). For example, if the average input power is –6 dBm, set the attenuation to 16 dB. This specification applies for the normal 3.5 dB peak-to-average ratio of a single code. Note that, if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- i. ACPR accuracy at 10 MHz offset is warranted when the input attenuator is set to give an average mixer level of –14 dBm.
- j. In order to meet this specified accuracy, the mixer level must be optimized for accuracy when measuring node B Base Transmission Station (BTS) within 3 dB of the required –45 dBc ACPR. This optimum mixer level is –18 dBm, so the input attenuation must be set as close as possible to the average input power – (–18 dBm). For example, if the average input power is –6 dBm, set the attenuation to 12 dB. This specification applies for the normal 10 dB peak-to-average ratio (at 0.01% probability) for Test Model 1. Note that, if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.

- k. Accuracy can be excellent even at low ACPR levels assuming that the user sets the mixer level to optimize the dynamic range, and assuming that the analyzer and UUT distortions are incoherent. When the errors from the UUT and the analyzer are incoherent, optimizing dynamic range is equivalent to minimizing the contribution of analyzer noise and distortion to accuracy, though the higher mixer level increases the display scale fidelity errors. This incoherent addition case is commonly used in the industry and can be useful for comparison of analysis equipment, but this incoherent addition model is rarely justified. This derived accuracy specification is based on a mixer level of  $-14$  dBm.
- l. The dynamic range shown with Noise Correction = Off applies with Noise Floor Extension On. (Noise Correction is the process within the measurement of making a calibration of the noise floor at the exact analyzer settings used for the measurement. Noise Floor Extension is the factory calibration of the noise floor.)
- m. Keysight measures 100% of the signal analyzers for dynamic range in the factory production process. This measurement requires a near-ideal signal, which is impractical for field and customer use. Because field verification is impractical, Keysight only gives a typical result. More than 80% of prototype instruments met this "typical" specification; the factory test line limit is set commensurate with an on-going 80% yield to this typical. The ACPR dynamic range is verified only at 2 GHz, where Keysight has the near-perfect signal available. The dynamic range is specified for the optimum mixer drive level, which is different in different instruments and different conditions. The test signal is a 1 DPCH signal.  
The ACPR dynamic range is the observed range. This typical specification includes no measurement uncertainty.
- n. ML is Mixer Level, which is defined to be the input signal level minus attenuation.
- o. All three production units hand-measured had performance better than 88 dB with a test signal even better than the "near-ideal" one used for statistical process control in production mentioned in the footnote<sup>m</sup> above. Therefore, this value can be considered "Nominal" not "Typical" by the definitions used within this document. These observations were done near 2 GHz because that is a common W-CDMA operating region in which the analyzer third-order dynamic range is near its best.
- p. 3GPP requires the use of a root-raised-cosine filter in evaluating the ACLR of a device. The accuracy of the passband shape of the filter is not specified in standards, nor is any method of evaluating that accuracy. This footnote discusses the performance of the filter in this instrument. The effect of the RRC filter and the effect of the RBW used in the measurement interact. The analyzer compensates the shape of the RRC filter to accommodate the RBW filter. The effectiveness of this compensation is summarized in three ways:
  - White noise in Adj Ch: The compensated RRC filter nominally has no errors if the adjacent channel has a spectrum that is flat across its width.
  - TOI-induced spectrum: If the spectrum is due to third-order intermodulation, it has a distinctive shape. The computed errors of the compensated filter are  $-0.001$  dB for the 100 kHz RBW used for UE testing with the IBW method. It is 0.000 dB for the 27 kHz RBW filter used for BTS testing with the Filtered IBW method. The worst error for RBWs between 27 and 390 kHz is 0.05 dB for a 330 kHz RBW filter.
  - rms CW error: This error is a measure of the error in measuring a CW-like spurious component. It is evaluated by computing the root of the mean of the square of the power error across all frequencies within the adjacent channel. The computed rms error of the compensated filter is 0.012 dB for the 100 kHz RBW used for UE testing with the IBW method. It is 0.000 dB for the 27 kHz RBW filter used for BTS testing. The worst error for RBWs between 27 kHz and 470 kHz is 0.057 dB for a 430 kHz RBW filter.

Fast ACPR Test [Plot<sup>a</sup>]

- a. Observation conditions for ACP speed:  
Display Off, signal is Test Model 1 with 64 DPCH, Method set to Fast. Measured with an IBM compatible PC with a 3 GHz Pentium 4 running Windows XP Professional Version 2002. The communications medium was PCI GPIB IEEE 488.2. The Test Application Language was .NET C#. The Application Communication Layer was Keysight T&M Programmer's Toolkit Redistributable Package 2.1, Keysight I/O Libraries 15.1.

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 30 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about −18 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 30 kHz RBW, at a center frequency of 2 GHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- The absolute accuracy of SEM measurement is the same as the absolute accuracy of the spectrum analyzer. See **“Absolute Amplitude Accuracy” on page 39** for more information. The numbers shown are for 0 to 3.6 GHz, with attenuation set to 10 dB.

## Options

The following options and applications affect instrument specifications.

<i>Option 503:</i>	Frequency range, 3 Hz to 3.6 GHz
<i>Option 508:</i>	Frequency range, 3 Hz to 8.4 GHz
<i>Option 513:</i>	Frequency range, 3 Hz to 13.6 GHz
<i>Option 526:</i>	Frequency range, 3 Hz to 26.5 GHz
<i>Option 543:</i>	Frequency range, 3 Hz to 43 GHz
<i>Option 544:</i>	Frequency range, 3 Hz to 44 GHz
<i>Option 550:</i>	Frequency range, 3 Hz to 50 GHz
<i>Option ALV:</i>	Auxiliary Log Video output
<i>Option B1X:</i>	Analysis bandwidth, 160/140 MHz <sup>a</sup>
<i>Option B25:</i>	Analysis bandwidth, 25 MHz
<i>Option B40:</i>	Analysis bandwidth, 40 MHz
<i>Option B85:</i>	Analysis bandwidth, 85 MHz
<i>Option BBA:</i>	BBIQ inputs, analog
<i>Option C35:</i>	APC 3.5 mm connector (for Freq <i>Option 526</i> only)
<i>Option CR3:</i>	Connector Rear, second IF Out
<i>Option CRP:</i>	Connector Rear, arbitrary IF Out
<i>Option EA3:</i>	Electronic attenuator, 3.6 GHz
<i>Option EMC:</i>	Precompliance EMC Features
<i>Option ESC:</i>	External source control
<i>Option EXM:</i>	External mixing
<i>Option LNP:</i>	Low Noise Path
<i>Option MPB:</i>	Preselector bypass
<i>Option NFE:</i>	Noise floor extension, instrument alignment
<i>Option P03:</i>	Preamplifier, 3.6 GHz
<i>Option P08:</i>	Preamplifier, 8.4 GHz
<i>Option P13:</i>	Preamplifier, 13.6 GHz
<i>Option P26:</i>	Preamplifier, 26.5 GHz
<i>Option P43:</i>	Preamplifier, 43 GHz
<i>Option P44:</i>	Preamplifier, 44 GHz

## PXA Signal Analyzer Options

<i>Option P50:</i>	Preamplifier, 50 GHz
<i>Option RT1:</i>	Real-time analysis up to 160 MHz, basic detection
<i>Option RT2:</i>	Real-time analysis up to 160 MHz, optimum detection
<i>Option TDS:</i>	Time domain scan
<i>Option YAS:</i>	Y-Axis Screen Video output
<i>Option YAV:</i>	Y-Axis Video output

N9082B:	LTE-Advanced TDD measurement application
N9083A:	Multi-Standard Radio (MSR) measurement application

- a. Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.

## General

Description	Specifications	Supplemental Information
<b>Calibration Cycle</b>	1 year	

Description	Specifications	Supplemental Information
<b>Temperature Range</b>  Operating <sup>a</sup> Altitude ≤ 2,300 m Altitude = 4,500 m Derating <sup>b</sup>  Storage <sup>c</sup>  <b>Altitude</b> <sup>d</sup>  Humidity Relative humidity	   0 to 55°C 0 to 47°C   –40 to +70°C  4,500 m (approx 15,000 feet)	          Type tested at 95%, +40°C (non-condensing)

- a. For earlier instruments (S/N <MY49430337/SG49430006/US49230450), the operating temperature ranges from 5 to 50°C.
- b. The maximum operating temperature derates linearly from altitude of 4,500 m to 2,300 m.
- c. For earlier instruments (S/N <MY49430337/SG49430006/US49230450), and installed with hard disk drives, the storage temperature ranges from –40 to +65°C.
- d. For earlier instrument (S/N <MY49430337/SG49430006/US49230450), the altitude was specified as 3,000 m (approximately 10,000 feet).

Description	Specifications	Supplemental Information
<b>Environmental and Military Specifications</b>		Samples of this product have been type tested in accordance with the Keysight Environmental Test Manual and verified to be robust against the environmental stresses of Storage, Transportation and End-use; those stresses include but are not limited to temperature, humidity, shock, vibration, altitude and power line conditions. Test Methods are aligned with IEC 60068-2 and levels are similar to MIL-PRF-28800F Class 3.

Description	Specifications
<b>EMC</b>	<p>Complies with European EMC Directive 2004/108/EC</p> <ul style="list-style-type: none"> <li>– IEC/EN 61326-1 or IEC/EN 61326-2-1</li> <li>– CISPR Pub 11 Group 1, class A<sup>a</sup></li> <li>– AS/NZS CISPR 11</li> <li>– ICES/NMB-001</li> </ul> <p>This ISM device complies with Canadian ICES-001. Cet appareil ISM est conforme a la norme NMB-001 du Canada.</p>

- a. The N9030A is in full compliance with CISPR 11, Class A emission limits and is declared as such. In addition, the N9030A has been type tested and shown to meet CISPR 11, Class B emission limits. USB accessories may affect the PXA's conformance to Class B emissions. Information regarding the Class B emission performance of the N9030A is provided as a convenience to the user and is not intended to be a regulatory declaration.

<b>LAN TCP/IP Interface</b>	RJ45 Ethertwist	1000BaseT

## Regulatory Information

This product is designed for use in Installation Category II and Pollution Degree 2 per IEC 61010 3rd ed, and 664 respectively.

This product has been designed and tested in accordance with accepted industry standards, and has been supplied in a safe condition. The instruction documentation contains information and warnings which must be followed by the user to ensure safe operation and to maintain the product in a safe condition.

	The CE mark is a registered trademark of the European Community (if accompanied by a year, it is the year when the design was proven). This product complies with all relevant directives.
ICES/NMB-001	"This ISM device complies with Canadian ICES-001." "Cet appareil ISM est conforme a la norme NMB du Canada."
ISM 1-A (GRP.1 CLASS A)	This is a symbol of an Industrial Scientific and Medical Group 1 Class A product. (CISPR 11, Clause 4)
	The CSA mark is a registered trademark of the CSA International.
	The RCM mark is a registered trademark of the Australian Communications and Media Authority.
	This symbol indicates separate collection for electrical and electronic equipment mandated under EU law as of August 13, 2005. All electric and electronic equipment are required to be separated from normal waste for disposal (Reference WEEE Directive 2002/96/EC).
	China RoHS regulations include requirements related to packaging, and require compliance to China standard GB18455-2001.
	This symbol indicates compliance with the China RoHS regulations for paper/fiberboard packaging.
	<p><b>South Korean Class A EMC Declaration</b> A 급 기기 ( 업무용 방송통신기자재 ) 이 기기는 업무용 ( A 급 ) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라 며 , 가정외의 지역에서 사용하는 것을 목적으로 합니다.</p> <p>This equipment is Class A suitable for professional use and is for use in electromagnetic environments outside of the home.</p>

**EMC:** Complies with the essential requirements of the European EMC Directive as well as current

editions of the following standards (dates and editions are cited in the Declaration of Conformity):

- IEC/EN 61326-1
- CISPR Pub 11 Group 1, class A
- AS/NZS CISPR 11
- ICES/NMB-001

This ISM device complies with Canadian ICES-001.

Cet appareil ISM est conforme a la norme NMB-001 du Canada.

**South Korean Class A EMC declaration:** This equipment is Class A suitable for professional use

and is for use in electromagnetic environments outside of the home.

(업무용 방송통신기자재)이 기기는 업무용 (A 급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

**SAFETY:** Complies with the essential requirements of the European Low Voltage Directive as well as current editions of the following standards (dates and editions are cited in the Declaration of Conformity):

- IEC/EN 61010-1
- Canada: CSA C22.2 No. 61010-1
- USA: UL std no. 61010-1

**Acoustic statement:** (European Machinery Directive)

Acoustic noise emission

LpA <70 dB

Operator position

Normal operation mode per ISO 7779

## 2 I/Q Analyzer

This chapter contains specifications for the I/Q Analyzer measurement application (Basic Mode).

## Specifications Affected by I/Q Analyzer

Specification Name	Information
Number of Frequency Display Trace Points (buckets)	Does not apply.
Resolution Bandwidth	See <b>“Frequency” on page 91</b> in this chapter.
Video Bandwidth	Not available.
Clipping-to-Noise Dynamic Range	See <b>“Clipping-to-Noise Dynamic Range” on page 92</b> in this chapter.
Resolution Bandwidth Switching Uncertainty	Not specified because it is negligible.
Available Detectors	Does not apply.
Spurious Responses	The <b>“Spurious Responses” on page 55</b> of core specifications still apply. Additional bandwidth-option-dependent spurious responses are given in the Analysis Bandwidth chapter for any optional bandwidths in use.
IF Amplitude Flatness	See <b>“IF Frequency Response” on page 37</b> of the core specifications for the 10 MHz bandwidth. Specifications for wider bandwidths are given in the Analysis Bandwidth chapter for any optional bandwidths in use.
IF Phase Linearity	See <b>“IF Phase Linearity” on page 38</b> of the core specifications for the 10 MHz bandwidth. Specifications for wider bandwidths are given in the Analysis Bandwidth chapter for any optional bandwidths in use.
Data Acquisition	See <b>“Data Acquisition” on page 93</b> in this chapter for the 10 MHz bandwidth. Specifications for wider bandwidths are given in the Analysis Bandwidth chapter for any optional bandwidths in use.

## Frequency

Description	Specifications	Supplemental Information
<b>Frequency Span</b>		
Standard instrument	10 Hz to 10 MHz	
<i>Option B25</i>	10 Hz to 25 MHz	
<i>Option B40</i>	10 Hz to 40 MHz	
<i>Option B85</i>	10 Hz to 85 MHz	
<i>Option B1X</i>	10 Hz to 160 MHz <sup>a</sup>	
<b>Resolution Band width</b> (Spectrum Measurement) Range		
Overall	100 mHz to 3 MHz	
Span = 1 MHz	50 Hz to 1 MHz	
Span = 10 kHz	1 Hz to 10 kHz	
Span = 100 Hz	100 mHz to 100 Hz	
Window Shapes	Flat Top, Uniform, Hanning, Hamming, Gaussian, Blackman, Blackman-Harris, Kaiser Bessel (K-B 70 dB, K-B 90 dB & K-B 110 dB)	
<b>Analysis Band width</b> (Span) (Waveform Measurement)		
Standard instrument	10 Hz to 10 MHz	
<i>Option B25</i>	10 Hz to 25 MHz	
<i>Option B40</i>	10 Hz to 40 MHz	
<i>Option B85</i>	10 Hz to 85 MHz	
<i>Option B1X</i>	10 Hz to 160 MHz <sup>a</sup>	

a. Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.

## Clipping-to-Noise Dynamic Range

Description	Specifications	Supplemental Information
<b>Clipping-to-Noise Dynamic Range<sup>a</sup></b>		Excluding residuals and spurious responses
Clipping Level at Mixer		Center frequency $\geq 20$ MHz
IF Gain = Low	–10 dBm	–8 dBm (nominal)
IF Gain = High	–20 dBm	–17.5 dBm (nominal)
Noise Density at Mixer at center frequency <sup>b</sup>	$(\text{DANL}^c + \text{IFGainEffect}^d) + 2.25$ dB <sup>e</sup>	Example <sup>f</sup>

- This specification is defined to be the ratio of the clipping level (also known as “ADC Over Range”) to the noise density. In decibel units, it can be defined as  $\text{clipping\_level [dBm]} - \text{noise\_density [dBm/Hz]}$ ; the result has units of dBFS/Hz (fs is “full scale”).
- The noise density depends on the input frequency. It is lowest for a broad range of input frequencies near the center frequency, and these specifications apply there. The noise density can increase toward the edges of the span. The effect is nominally well under 1 dB.
- The primary determining element in the noise density is the **“Displayed Average Noise Level” on page 49**.
- DANL is specified with the IF Gain set to High, which is the best case for DANL but not for Clipping-to-noise dynamic range. The core specifications **“Displayed Average Noise Level” on page 49**, gives a line entry on the excess noise added by using IF Gain = Low, and a footnote explaining how to combine the IF Gain noise with the DANL.
- DANL is specified for log averaging, not power averaging, and thus is 2.51 dB lower than the true noise density. It is also specified in the narrowest RBW, 1 Hz, which has a noise bandwidth slightly wider than 1 Hz. These two effects together add up to 2.25 B.
- As an example computation, consider this: For the case where  $\text{DANL} = -151$  dBm in 1 Hz, IF Gain is set to low, and the “Additional DANL” is  $-160$  dBm, the total noise density computes to  $-148.2$  dBm/Hz and the Clipping-to-noise ratio for a  $-10$  dBm clipping level is  $-138.2$  dBFS/Hz.

## Data Acquisition

Description	Specifications	Supplemental Information
Time Record Length Analysis Tool <b>IQ Analyzer</b> Advanced Tools	4,000,000 IQ sample pairs <b>Data Packing</b> <b>32-bit</b> <b>64-bit</b>	Waveform measurement <sup>a</sup> 89600 VSA software or Fast Capture <sup>b</sup>
Length (IQ sample pairs)	536 MSa ( $2^{29}$ Sa)      268 MSa ( $2^{28}$ Sa)	2 GB total memory
<b>Maximum IQ Capture Time</b> (89600 VSA and Fast Capture) 10 MHz IFBW	<b>Data Packing</b> <b>32-bit</b> 42.94 s <b>64-bit</b> 21.47 s	Calculated by: Length of IQ sample pairs/Sample Rate (IQ Pairs) <sup>c</sup>
Sample Rate (IQ Pairs)	$1.25 \times \text{IFBW}$	
<b>ADC Resolution</b>	16 bits	

- This can also be accessed with the remote programming command of "read:wav0?".
- This can only be accessed with the remote programming command of "init:fcap" in the IQ Analyzer (Basic) waveform measurement.
- For example, using 32-bit data packing at 10 MHz IF bandwidth (IFBW) the Maximum Capture Time is calculated using the formula: "Max Capture Time = ( $2^{29}$ )/(10 MHz  $\times$  1.25)".

### 3 VXA Vector Signal Analysis Application

This chapter contains specifications for the N9064A<sup>1</sup> VXA vector signal modulation analysis measurement application.

#### Additional Definitions and Requirements

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

#### Specs & Nominals

These specifications summarize the performance for the X-Series Signal Analyzer and apply to the VXA measurement application inside the analyzer. Values shown in the column labeled "Specs & Nominals" are a mix of warranted specifications, guaranteed-by-design parameters, and conservative but not warranted observations of performance of sample instruments.

---

1. In software versions prior to A.06.00, the VXA measurement application product number was 89601X. Software versions A.06.00 and beyond have renamed 89601X to N9064A.

## Vector Signal Analysis Performance (N9064A-1FP/1TP)

### Frequency

Description	Specs & Nominals			Supplemental Information
Range				See “Frequency Range” on page 20
Center Frequency				
Tuning Resolution	1 mHz			
Frequency Span, Maximum	10 MHz (standard)			
FFT Spectrum	25 MHz (Option B25)			
	40 MHz (Option B40)			
	85 MHz (Option B85)			
	160/140 MHz (Option B1X) <sup>a</sup>			
Frequency Points per Span	Calibrated points: 51 to 409,601 Displayed points: 51 to 524,288			
FFT Window Type				The window choices allow the user to optimize as needed for best amplitude accuracy, best dynamic range, or best response to transient signal characteristics.
Window	Selectivity	Passband Flatness	Rejection	
Flat Top	0.41	0.01 dB	>95 dBc	
Gaussian Top	0.25	0.68 dB	>125 dBc	
Hanning	0.11	1.5 dB	>31 dBc	
Uniform	0.0014	4.0 dB	>13 dBc	

- a. Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.

## Input

Description	Specs & Nominals	Supplemental Information
<b>Range</b>		Full Scale, combines attenuator setting and ADC gain
Standard	–20 dBm to 30 dBm	
<i>Option P03, P08, P13, P26, P43, P44 or P50</i>	–40 dBm to 30 dBm, up to 3.6 GHz	
<i>Option P08</i>	–50 dBm to 30 dBm, 3.6 to 8.4 GHz	
<i>Option P13</i>	–50 dBm to 30 dBm, 3.6 to 13.6 GHz	
<i>Option P26</i>	–50 dBm to 30 dBm, 3.6 to 26.5 GHz	
<i>Option P43</i>	–50 dBm to 30 dBm, 3.6 to 43 GHz	
<i>Option P44</i>	–50 dBm to 30 dBm, 3.6 to 44 GHz	
<i>Option P50</i>	–50 dBm to 30 dBm, 3.6 to 50 GHz	
<b>ADC overload</b>	+2 dBFS	

## Amplitude Accuracy

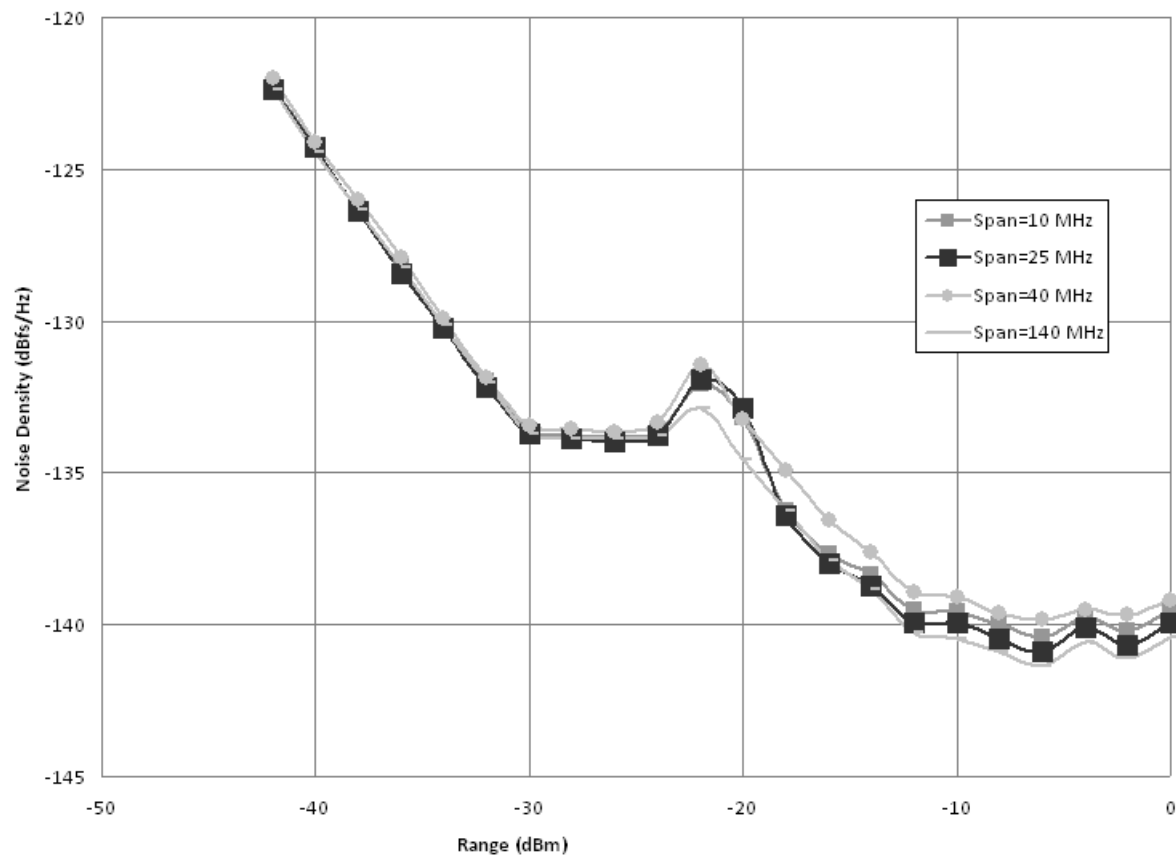

Description	Specs & Nominals	Supplemental Information
<b>Absolute Amplitude Accuracy</b>		See <a href="#">“Absolute Amplitude Accuracy” on page 39</a>
<b>Amplitude Linearity</b>		See <a href="#">“Display Scale Fidelity” on page 45</a>
<b>IF Flatness</b>		
Span $\leq$ 10 MHz		See <a href="#">“IF Frequency Response” on page 37</a>
Span $\leq$ 25 MHz ( <i>Option B25</i> )		See <a href="#">“IF Frequency Response” on page 114</a>
Span $\leq$ 40 MHz ( <i>Option B40</i> )		See <a href="#">“IF Frequency Response” on page 124</a>
Span $\leq$ 85 MHz ( <i>Option B85</i> )		See <a href="#">“IF Frequency Response” on page 136</a>
Span = 160/140 MHz ( <i>Option B1X</i> ) <sup>a</sup>		See <a href="#">“IF Frequency Response” on page 136</a>
<b>Sensitivity</b>		
–20 dBm range		Compute from DANL <sup>b</sup> ; see <a href="#">“Displayed Average Noise Level (DANL) (without Noise Floor Extension)” on page 49</a>
–40 dBm range		Requires preamp option. Compute from Preamp DANL <sup>b</sup> ; see <a href="#">“Displayed Average Noise Level (DANL) (without Noise Floor Extension)” on page 211</a>

- Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.
- DANL is specified in the narrowest resolution bandwidth (1 Hz) with log averaging, in accordance with industry and historic standards. The effect of log averaging is to reduce the noise level by 2.51 dB. The effect of using a 1 Hz RBW is to increase the measured noise because the noise bandwidth of the 1 Hz RBW filter is nominally 1.056 Hz, thus adding 0.23 dB to the level. The combination of these effects makes the sensitivity, in units of dBm/Hz, 2.27 dB higher than DANL in units of dBm in a 1 Hz RBW.

## Dynamic Range

Description	Specs & Nominals	Supplemental Information
<b>Third Order Intermodulation distortion</b> (Two –20 dBFS tones, 400 MHz to 13.6 GHz, tone separation > 5 × IF Prefilter BW)		–90 dBc (nominal)
<b>Residual Responses</b> (Range ≥ –10 dBm) 200 kHz to 8.4 GHz 8.4 GHz to 26.5 GHz	–90 dBFS	
<b>Image Responses</b> (10 MHz to 13.6 GHz, <8 MHz span)	–78 dBc	–90 dBFS (nominal)
<b>LO Related Spurious</b> (10 MHz to 3.6 GHz, f > 600 MHz from carrier)	–73 dBc	
<b>Other Spurious</b>		See the related analysis bandwidth option chapter, such as <i>Option B25</i>

Nominal Noise Density [Plot]

## Analog Modulation Analysis (N9064A-1FP/1TP)

Description	Specs & Nominals	Supplemental Information
<b>AM Demodulation</b> (Span $\leq 12$ MHz, Carrier $\leq -17$ dBFS)		
Demodulator Bandwidth	Same as selected measurement span	
Modulation Index Accuracy	$\pm 1\%$	
Harmonic Distortion	$-60$ dBc	Relative to 100% modulation index
Spurious	$-60$ dBc	Relative to 100% modulation index
Cross Demodulation	0.3% AM on an FM signal with 50 kHz modulation rate, 200 kHz deviation	
<b>PM Demodulation</b> (Deviation $< 180^\circ$ , modulation rate $\leq 500$ kHz, span $\leq 12$ MHz)		
Demodulator Bandwidth	Same as selected measurement span, except as noted	
Modulation Index Accuracy	$\pm 0.5^\circ$	
Harmonic Distortion	0.3%	
Spurious	$-60$ dBc	
Cross Demodulation	1° PM on an 80% modulation index AM signal, modulation rate $\leq 1$ MHz	

VXA Vector Signal Analysis Application  
Analog Modulation Analysis (N9064A-1FP/1TP)

Description	Specs & Nominals		Supplemental Information
FM Demodulation			
Demodulator Bandwidth	Same as selected measurement span		
Modulation Index Accuracy (deviation ≤ 2 MHz, modulation rate ≤ 500 kHz)	±0.1% of span		
Harmonic Distortion			
<div>Modulation Rate</div>	<div>Deviation</div>		
≤50 kHz	≤200 kHz	−60 dBc	
≤500 kHz	≤2 MHz	−55 dBc	
Spurious			
<div>Modulation Rate</div>	<div>Deviation</div>		
≤50 kHz	≤200 kHz	−50 dBc	
≤500 kHz	≤2 MHz	−45 dBc	
Cross Demodulation	0.5% of span of FM on an 80% modulation index AM signal, modulation rate ≤ 1 MHz

a. tfa = transmitter frequency  $\times$  frequency reference accuracy.

1. These options were discontinued January 2014.

## 4 Option ALV – Log Video Out

This chapter contains specifications for Option ALV, Log Video Out.

## Specifications Affected by Log Video Out

No other analyzer specifications are affected by the presence or use of this option. New specifications are given in the following pages.

## Other Log Video Out Specifications

### Aux IF Out Port

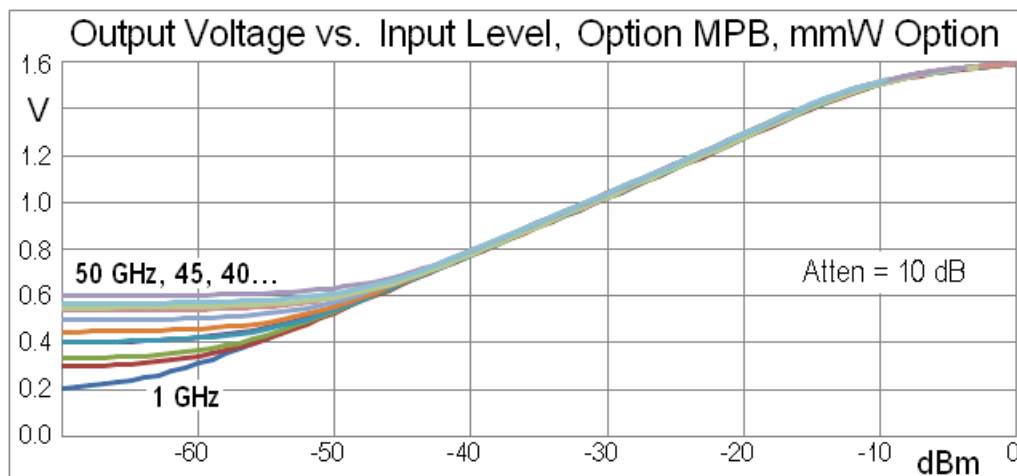

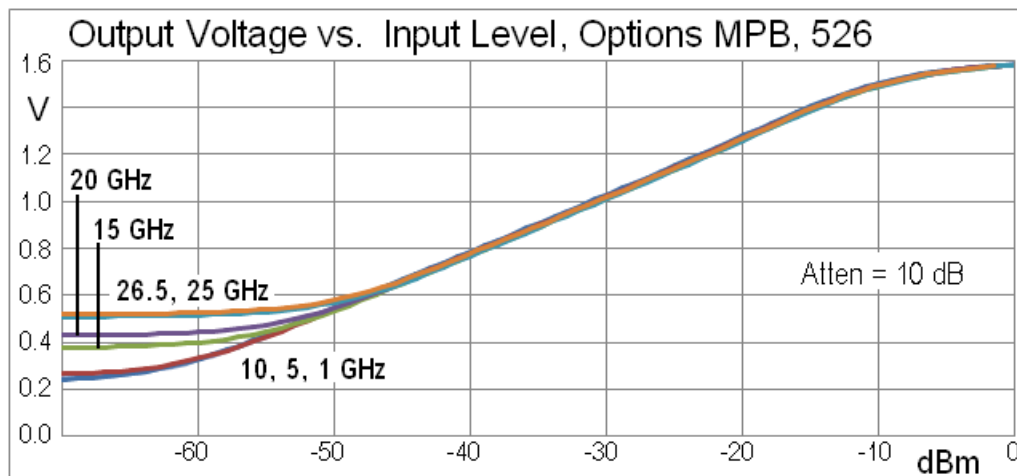

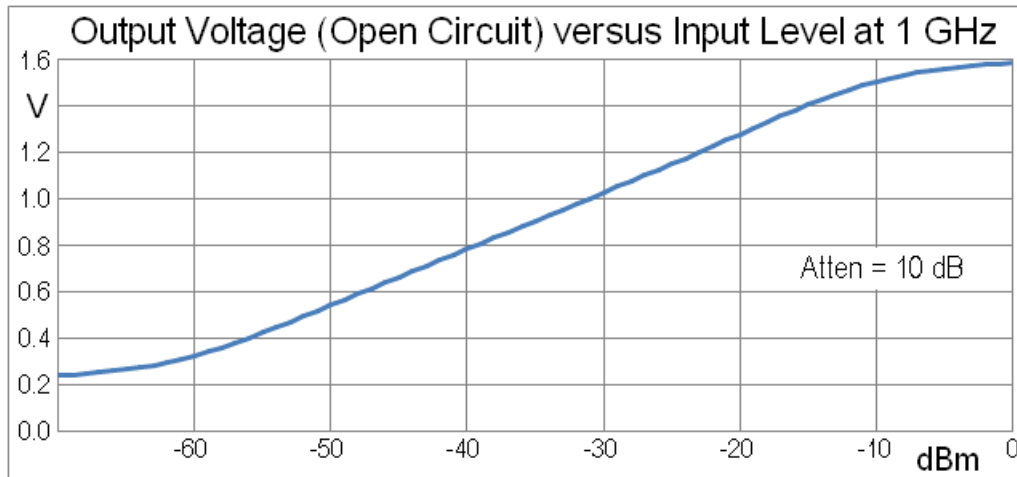

Description	Specifications	Supplemental Information
Connector	SMA female	Shared with other options
Impedance		50 $\Omega$ (nominal)

### Fast Log Video Output

Description	Specifications	Supplemental Information
<b>Fast Log Video Output</b> (Preselector bypassed <i>(Option MPB)</i> for Bands 1-4, Preamp Off)		
Output voltage		Open-circuit voltages shown
Maximum		1.6 V at -10 dBm <sup>a</sup> (nominal)
Slope		25 $\pm$ 1 mV/dB (nominal)
Log Fidelity		
Range		49 dB (nominal) with input frequency at 1 GHz <sup>b</sup>
Accuracy within Range		$\pm$ 1.0 dB (nominal)
Rise Time		15 ns (nominal)
Fall Time		
Bands 1-4 with <i>Option MPB</i>		40 ns (nominal)
Other Cases		Depends on bandwidth <sup>c</sup>

- The signal level which gives an output corresponding to the high end of the log fidelity range, nominally -10 dBm at the mixer, has a band and frequency dependence that is the same as that given in the "Conversion Gain" entry in the specifications for **"Second IF Out" on page 167**.
- Refer to the next page for details.
- The bandwidth will be the same as for the **"Second IF Out" on page 167**. The bandwidth effects will dominate the fall time in high band with preselection.

Nominal Output Voltage (Open Circuit) versus Input Level [Plot]

## 5 Option B25 – 25 MHz Analysis Bandwidth

This chapter contains specifications for the *Option B25* 25 MHz Analysis Bandwidth, and are unique to this IF Path.

## Specifications Affected by Analysis Bandwidth

The specifications in this chapter apply when the 25 MHz path is in use. In IQ Analyzer, this will occur when the IF Path is set to 25 MHz, whether by Auto selection (depending on Span) or manually.

Specification Name	Information
IF Frequency Response	See specifications in this chapter.
IF Phase Linearity	See specifications in this chapter.
Spurious and Residual Responses	The <b>“Spurious Responses” on page 55</b> still apply. Further, bandwidth-option-dependent spurious responses are contained within this chapter.
Displayed Average Noise Level, Third-Order Intermodulation and Phase Noise	The performance of the analyzer will degrade by an unspecified extent when using this bandwidth option. This extent is not substantial enough to justify statistical process control.

## Other Analysis Bandwidth Specifications

Description				Specifi- cations	Supplemental Information
<b>IF Spurious Response<sup>a</sup></b>					Preamp Off <sup>b</sup>
IF Second Harmonic					
<b>Apparent Freq</b>	<b>Excitation Freq</b>	<b>Mixer Level<sup>c</sup></b>	<b>IF Gain</b>		
Any on-screen f	$(f + f_c + 22.5 \text{ MHz})/2$	-15 dBm	Low		-54 dBc (nominal)
		-25 dBm	High		-54 dBc (nominal)
IF Conversion Image					
<b>Apparent Freq</b>	<b>Excitation Freq</b>	<b>Mixer Level<sup>c</sup></b>	<b>IF Gain</b>		
Any on-screen f	$2 \times f_c - f + 45 \text{ MHz}$	-10 dBm	Low		-70 dBc (nominal)
		-20 dBm	High		-70 dBc (nominal)

- The level of these spurs is not warranted. The relationship between the spurious response and its excitation is described in order to make it easier for the user to distinguish whether a questionable response is due to these mechanisms. f is the apparent frequency of the spurious signal,  $f_c$  is the measurement center frequency.
- The spurious response specifications only apply with the preamp turned off. When the preamp is turned on, performance is nominally the same as long as the mixer level is interpreted to be Mixer Level = Input Level – Input Attenuation – Preamp Gain.
- Mixer Level = Input Level – Input Attenuation.

Option B25 - 25 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description			Specifications	Supplemental Information		
<b>IF Frequency Response<sup>a</sup></b>				Freq <i>Option 526</i> only Modes above 18 GHz <sup>b</sup>		
(Demodulation and FFT response relative to the center frequency)						
Center Freq (GHz)	Span <sup>c</sup> (MHz)	Preselector	Max Error <sup>d</sup>	Mid width Error (95th Percentile)	Slope (dB/MHz) (95th Percentile)	RMS <sup>e</sup> (nominal)
≥0.02, ≤3.6	10 to ≤25	n/a	±0.30 dB	±0.12 dB	±0.10	0.02 dB
3.6 to 26.5	10 to ≤25 <sup>f</sup>	On				0.50 dB
3.6 to 26.5	10 to ≤25	Off <sup>g</sup>	±0.40 dB	±0.12 dB	±0.10	0.030 dB
26.5 to 50	10 to ≤25 <sup>f</sup>	On				0.31 dB
26.5 to 50	10 to ≤25	Off <sup>g</sup>	±0.40 dB			0.02 dB

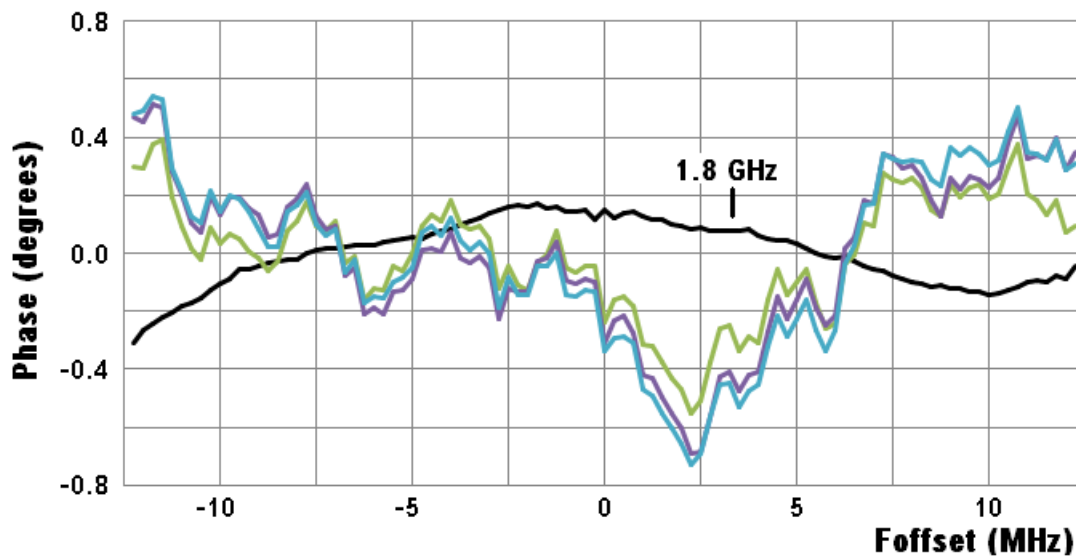

- The IF frequency response includes effects due to RF circuits such as input filters, that are a function of RF frequency, in addition to the IF passband effects.
- Signal frequencies above 18 GHz are prone to additional response errors due to modes in the Type-N connector used. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. These modes cause nominally up to -0.35 dB amplitude change, with phase errors of nominally up to ±1.2°.
- This column applies to the instantaneous analysis bandwidth in use. In the Spectrum analyzer Mode, this would be the FFT width. For Span < 10 MHz. see **"IF Frequency Response" on page 37**.
- The maximum error at an offset (f) from the center of the FFT width is given by the expression ± [Midwidth Error + (f × Slope)], but never exceeds ±Max Error. Here the Midwidth Error is the error at the center frequency for the given FFT span. Usually, the span is no larger than the FFT width in which case the center of the FFT width is the center frequency of the analyzer. In the Spectrum Analyzer mode, when the analyzer span is wider than the FFT width, the span is made up of multiple concatenated FFT results, and thus has multiple centers of FFT widths so the f in the equation is the offset from the nearest center. These specifications include the effect of RF frequency response as well as IF frequency response at the worst case center frequency. Performance is nominally three times better at most center frequencies.
- The "RMS" nominal performance is the standard deviation of the response relative to the center frequency, integrated across the span. This performance measure was observed at a center frequency in each harmonic mixing band, which is representative of all center frequencies; it is not the worst case frequency.
- For information on the preselector which affects the passband for frequencies above 3.6 GHz when *Option MPB* is not in use, see **"Preselector Bandwidth" on page 31**.
- Option MPB is installed and enabled.

Option B25 - 25 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description			Specifications	Supplemental Information	
<b>IF Phase Linearity</b>				Deviation from mean phase linearity For Freq <i>Option 526</i> only: Modes above 18 GHz	
<b>Center Freq (GHz)</b>	<b>Span (MHz)</b>	<b>Preselector</b>		<b>Peak-to-peak (nominal)</b>	<b>RMS (nominal)<sup>a</sup></b>
≥0.02, ≤3.6	25	n/a		0.48°	0.12°
>3.6	25	Off <sup>b</sup>		0.85°	0.20°

- The listed performance is the standard deviation of the phase deviation relative to the mean phase deviation from a linear phase condition, where the RMS is computed across the span shown.
- Option MPB is installed and enabled.

Nominal Phase Linearity [Plot]

The phase characteristics of analysis frequencies below 3.6 GHz are similar to the 1.8 GHz graph shown. For analysis above 3.6 GHz, the curves shown are representative. They were measured between 5 and 25 GHz. The phase linearity of the analyzer does not depend on the frequency option.

Option B25 - 25 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description	Specification	Supplemental Information
<b>Full Scale (ADC Clipping)<sup>a</sup></b>		
Default settings, signal at CF (IF Gain = Low)		
Band 0		–8 dBm mixer level <sup>b</sup> (nominal)
Band 1 through 4		–7 dBm mixer level <sup>b</sup> (nominal)
High Gain setting, signal at CF (IF Gain = High)		
Band 0		–18 dBm mixer level <sup>b</sup> (nominal), subject to gain limitations <sup>c</sup>
Band 1 through 6		–17 dBm mixer level <sup>b</sup> (nominal), subject to gain limitations <sup>c</sup>
Effect of signal frequency $\neq$ CF		up to $\pm 3$ dB (nominal)

- This table is meant to help predict the full-scale level, defined as the signal level for which ADC overload (clipping) occurs. The prediction is imperfect, but can serve as a starting point for finding that level experimentally. A SCPI command is also available for that purpose.
- Mixer level is signal level minus input attenuation.
- The available gain to reach the predicted mixer level will vary with center frequency. Combinations of high gains and high frequencies will not achieve the gain required, increasing the full scale level.

## Data Acquisition

Description	Specifications		Supplemental Information
Time Record Length			
Analysis Tool			
IQ Analyzer	4,000,000 IQ sample pairs		Waveform measurement <sup>a</sup>
Advanced Tools	<b>Data Packing</b>		89600 VSA software or Fast Capture <sup>b</sup>
	<b>32-bit</b>	<b>64-bit</b>	
Length (IQ sample pairs)	536 MSa ( $2^{29}$ Sa)	268 MSa ( $2^{28}$ Sa)	2 GB total memory
<b>Maximum IQ Capture Time</b>	<b>Data Packing</b>		
(89600 VSA and Fast Capture <sup>b</sup> )	<b>32-bit</b>	<b>64-bit</b>	Calculated by: Length of IQ sample pairs/Sample Rate (IQ Pairs) <sup>c</sup>
10 MHz IFBW	42.94 s	21.47 s	
25 MHz IFBW	17.17 s	8.58 s	
Sample Rate (IQ Pairs)	1.25 × IFBW		
<b>ADC Resolution</b>	16 bits		

- This can also be accessed with the remote programming command of "read:wav0?".
- This can only be accessed with the remote programming command of "init:fcap" in the IQ Analyzer (Basic) waveform measurement.
- For example, using 32-bit data packing at 10 MHz IF bandwidth (IFBW) the Maximum Capture Time is calculated using the formula: "Max Capture Time = ( $2^{29}$ )/(10 MHz × 1.25)".

Option B25 - 25 MHz Analysis Bandwidth  
Data Acquisition

## 6 Option B40 – 40 MHz Analysis Bandwidth

This chapter contains specifications for the *Option B40* 40 MHz Analysis Bandwidth, and are unique to this IF Path.

## Specifications Affected by Analysis Bandwidth

The specifications in this chapter apply when the 40 MHz path is in use. In IQ Analyzer, this will occur when the IF Path is set to 40 MHz, whether by Auto selection (depending on Span) or manually.

Specification Name	Information
IF Frequency Response	See specifications in this chapter.
IF Phase Linearity	See specifications in this chapter.
Spurious Responses	There are three effects of the use of Option B40 on spurious responses. Most of the warranted elements of the <b>“Spurious Responses” on page 55</b> still apply without changes, but the revised-version of the table on <b>page 55</b> , modified to reflect the effect of Option B40, is shown in its place in this chapter. The image responses part of that table have the same warranted limits, but apply at different frequencies as shown in the table. The "higher order RF spurs" line is slightly degraded. Also, spurious-free dynamic range specifications are given in this chapter, as well as IF Residuals.
Displayed Average Noise Level	See specifications in this chapter.
Third-Order Intermodulation	This bandwidth option can create additional TOI products to those that are created by other instrument circuitry. These products do not behave with typical analog third-order behavior, and thus cannot be specified in the same manner. Nominal performance statements are given in this chapter, but they cannot be expected to decrease as the cube of the voltage level of the signals.
Phase Noise	The performance of the analyzer will degrade by an unspecified extent when using wideband analysis. This extent is not substantial enough to justify statistical process control.
Absolute Amplitude Accuracy	Nominally 0.5 dB degradation from base instrument absolute amplitude accuracy. (Refer to <b>Absolute Amplitude Accuracy on page 39.</b> )
Frequency Range Over Which Specifications Apply	Specifications on this bandwidth only apply with center frequencies of 30 MHz and higher.

## Other Analysis Bandwidth Specifications

Description	Specifications	Supplemental Information
<b>SFDR (Spurious-Free Dynamic Range)</b> Signal Frequency within $\pm 12$ MHz of center Signal Frequency anywhere within analysis BW Spurious response within $\pm 18$ MHz of center Response anywhere within analysis BW		Test conditions <sup>a</sup> –80 dBc (nominal)  –79 dBc (nominal) –77 dBc (nominal)

a. Signal level is –6 dB relative to full scale at the center frequency. See the Full Scale table.

<b>Third Order Intermodulation Distortion</b>		Two tones of equal level 1 MHz tone separation Each tone –9 dB relative to full scale (ADC clipping) IF Gain = Low IF Gain Offset = 0 dB Preselector Bypassed <sup>a</sup> ( <i>Option MPB</i> ) in Bands 1 through 4	
		Freq Option ≤ 526	Freq Option > 526
		Band 0	–83 dBc (nominal)
		Band 1	–83 dBc (nominal)
		Band 2	–82 dBc (nominal)
		Band 3	–75 dBc (nominal)
		Band 4	–67 dBc (nominal)

a. When using the preselector, performance is similar.

Option B40 – 40 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description		Specifications		Supplemental Information
Noise Density with Preselector Bypass ( <i>Option MPB</i> )				0 dB attenuation; Preselector bypassed above Band 0; center of IF bandwidth <sup>a</sup>
<b>Band</b>	<b>Freq (GHz)<sup>b</sup></b>	<b>IF Gain<sup>c</sup> = Low</b>	<b>IF Gain = High</b>	
0	1.80	–144 dBm/Hz	–144 dBm/Hz	
1	5.95	–140 dBm/Hz	–140 dBm/Hz	
2	10.95	–141 dBm/Hz	–141 dBm/Hz	
3	15.30	–135 dBm/Hz	–135 dBm/Hz	
4	21.75	–133 dBm/Hz	–133 dBm/Hz	
5	30	–130 dBm/Hz	–130 dBm/Hz	
6	42.2	–130 dBm/Hz	–130 dBm/Hz	

- The noise level in the IF will change for frequencies away from the center of the IF. Usually, the IF part of the total noise will get worse by nominally up to 3 dB as the edge of the IF bandwidth is approached.
- Specifications apply at the center of each band. IF Noise dominates the system noise, therefore the noise density will not change substantially with center frequency.
- IF Gain Offset = 0 dB. IF Gain = High is about 10 dB extra IF gain. High IF gain gives better noise levels to such a small extent that the warranted specifications do not change. High gain gives a full-scale level (ADC clipping) that is reduced by about 10 dB. For the best clipping-to-noise dynamic range, use IF Gain = Low and negative IF Gain Offset settings.

Description		Specifications	Supplemental Information
Noise Density without <i>Option MPB</i>			0 dB attenuation; center of IF bandwidth <sup>a</sup> , IF Gain = Low
<b>Band</b>	<b>Freq (GHz)<sup>b</sup></b>		<b>Nominal</b>

## 7 Option B85/B1X – 85/160 MHz Analysis Bandwidth

This chapter contains specifications for the *Option B85/B1X*, 85 or 160(140) MHz Analysis Bandwidth, and are unique to this IF Path.<sup>1</sup>

---

1. Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.

## Specifications Affected by Analysis Bandwidth

The specifications in this chapter apply when the 85/140/160<sup>1</sup> MHz path is in use. In IQ Analyzer, this will occur when the IF Path is set to 85/140/160 MHz, whether by Auto selection (depending on Span) or manually.

Specification Name	Information
IF Frequency Response	See specifications in this chapter.
IF Phase Linearity	See specifications in this chapter.
Spurious Responses	There are three effects of the use of Option B85/B1X on spurious responses. Most of the warranted elements of the <b>"Spurious Responses" on page 55</b> still apply without changes, but the revised-for-85/160-MHz table is shown in its place in this chapter. The image responses part of that table have the same warranted limits, but apply at different frequencies as shown in the table. The "higher order RF spurs" line is slightly degraded. Also, spurious-free dynamic range specifications are given in this chapter, as well as IF Residuals.
Displayed Average Noise Level	See specifications in this chapter.
Third-Order Intermodulation	This bandwidth option can create additional TOI products to those that are created by other instrument circuitry. These products do not behave with typical analog third-order behavior, and thus cannot be specified in the same manner. Nominal performance statements are given in this chapter, but they cannot be expected to decrease as the cube of the voltage level of the signals.
Phase Noise	The performance of the analyzer will degrade by an unspecified extent when using wideband analysis. This extent is not substantial enough to justify statistical process control.
Absolute Amplitude Accuracy	Nominally 0.5 dB degradation from base instrument absolute amplitude accuracy. (Refer to <b>Absolute Amplitude Accuracy on page 39.</b> )
Frequency Range Over Which Specifications Apply	Specifications on this bandwidth only apply with center frequencies of 100 MHz and higher.

1. Instruments with 160 MHz bandwidth will display "N9030A-B1Y Analysis bandwidth Extension, 160 MHz" after pressing: System, Show, System on the instrument.

# Other Analysis Bandwidth Specifications

Description	Specifications	Supplemental Information
<b>SFDR (Spurious-Free Dynamic Range)</b>		Test conditions <sup>a</sup>
Signal Frequency within $\pm 12$ MHz of center		-75 dBc (nominal)
Signal Frequency anywhere within analysis BW		
Spurious response within $\pm 63$ MHz of center		-74 dBc (nominal)
Response anywhere within analysis BW		-72 dBc (nominal)

a. Signal level is -6 dB relative to full scale at the center frequency. See the Full Scale table.

Residual Responses <sup>c</sup>				-100 dBm (nominal)
Image Responses				
<b>Tuned Freq (f)</b>	<b>Excitation Freq</b>	<b>Mixer Level<sup>d</sup></b>	<b>Response</b>	
10 MHz to 3.6 GHz	f+10200 MHz	-10 dBm	-80 dBc	-123 dBc (nominal)
10 MHz to 3.6 GHz	f+600 MHz	-10 dBm	-80 dBc	-106 dBc (nominal)
3.5 to 13.6 GHz	f+600 MHz	-10 dBm	-78 dBc	-104 dBc (nominal)
13.5 to 17.1 GHz	f+600 MHz	-10 dBm	-74 dBc	-103 dBc (nominal)
17.0 to 22 GHz	f+600 MHz	-10 dBm	-70 dBc	-102 dBc (nominal)
22 to 26.5 GHz	f+600 MHz	-10 dBm	-68 dBc	-99 dBc (nominal)
26.5 to 34.5 GHz	f+600 MHz	-30 dBm	-60 dBc	-96 dBc (nominal)
34.4 to 44 GHz	f+600 MHz	-30 dBm	-57 dBc	-93 dBc (nominal)
44 to 50 GHz	f+600 MHz	-30 dBm		-80 dBc (nominal)
Other Spurious Responses				
Carrier Frequency ≤ 26.5 GHz				
First RF Order <sup>e</sup> (f ≥ 10 MHz from carrier)		-10 dBm	-80 dBc + 20 × log(N <sup>f</sup> )	-120 dBc (nominal)
Higher RF Order <sup>g</sup> (f ≥ 10 MHz from carrier)		-40 dBm	-78 dBc + 20 × log(N <sup>f</sup> )	-103 dBc (nominal)
Carrier Frequency > 26.5 GHz				
First RF Order <sup>e</sup> (f ≥ 10 MHz from carrier)		30 dBm		-101 dBc (nominal)
Higher RF Order <sup>g</sup> (f ≥ 10 MHz from carrier)		-30 dBm		-100 dBc (nominal)
LO-Related Spurious Response Offset from carrier 200 Hz to 10 MHz		-10 dBm	-68 dBc <sup>h</sup> + 20 × log(N <sup>f</sup> )	
Line-Related Spurious Responses				-73 dBc <sup>h</sup> + 20 × log(N <sup>f</sup> ) (nominal)

a. Preselector enabled for frequencies > 3.6 GHz.

b. The spurious response specifications only apply with the preamp turned off. When the preamp is turned on, performance is nominally the same as long as the mixer level is interpreted to be: Mixer Level = Input Level – Input Attenuation – Preamp Gain

Option B85/B1X - 85/160 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

- c. Input terminated, 0 dB input attenuation.
- d. Mixer Level = Input Level – Input Attenuation. Verify with mixer levels no higher than –12 dBm if necessary to avoid ADC overload.
- e. With first RF order spurious products, the indicated frequency will change at the same rate as the input, with higher order, the indicated frequency will change at a rate faster than the input.
- f. N is the LO multiplication factor.
- g. RBW=100 Hz. With higher RF order spurious responses, the observed frequency will change at a rate faster than the input frequency.
- h. Nominally –40 dBc under large magnetic (0.38 Gauss rms) or vibrational (0.21 g rms) environmental stimuli.

>26.5, 50	≤140	Off <sup>d</sup>	±1.40 dB	±0.65 dB	0.12 dB
>3.6		On		See note <sup>e</sup>	

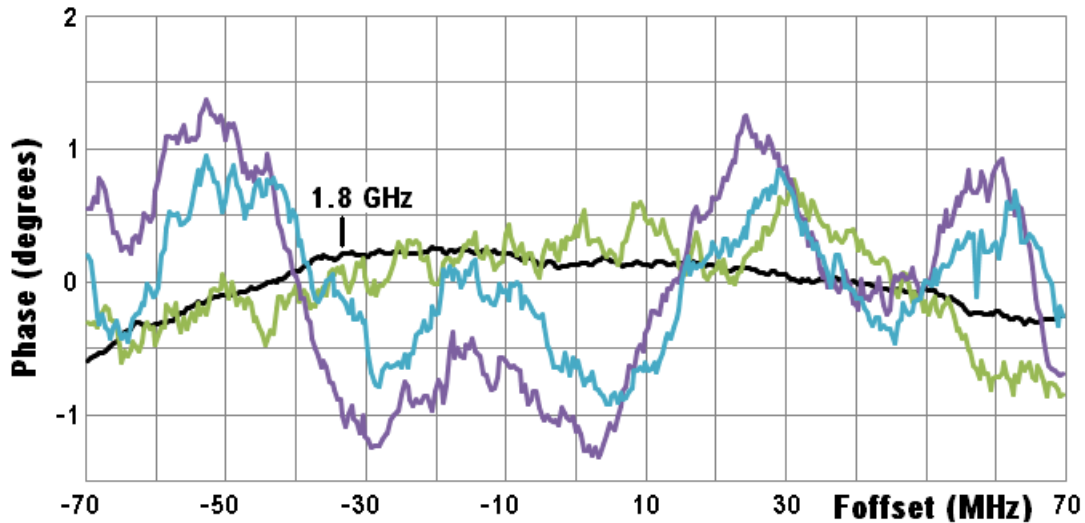

- The IF frequency response includes effects due to RF circuits such as input filters, that are a function of RF frequency, in addition to the IF pass-band effects.
- Signal frequencies above 18 GHz are prone to response errors due to modes in the Type-N connector. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. These modes cause nominally up to –0.35 dB amplitude change, with phase errors of nominally up to ±1.2°.
- The listed performance is the rms of the amplitude deviation from the mean amplitude response of a span/CF combination. 50% of the combinations of prototype instruments, center frequencies and spans had performance better than the listed values.
- Option MPB is installed and enabled.
- The passband shape will be greatly affected by the preselector. See **“Preselector Bandwidth” on page 31**.

Option B85/B1X - 85/160 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description			Specifications	Supplemental Information	
<b>IF Phase Linearity</b>				Deviation from mean phase linearity Freq <i>Option 526</i> only: Modes above 18 GHz <sup>a</sup>	
<b>Center Freq (GHz)</b>	<b>Span (MHz)</b>	<b>Preselector</b>		<b>Peak-to-peak (nominal)</b>	<b>RMS (nominal)<sup>b</sup></b>
≥0.03, <3.6	≤140	n/a		0.9°	0.20°
	≤160	n/a		1.7°	0.42°
≥3.6, ≤50	≤140	Off <sup>c</sup>		1.6°	0.39°
	≤160	Off <sup>c</sup>		2.8°	0.64°

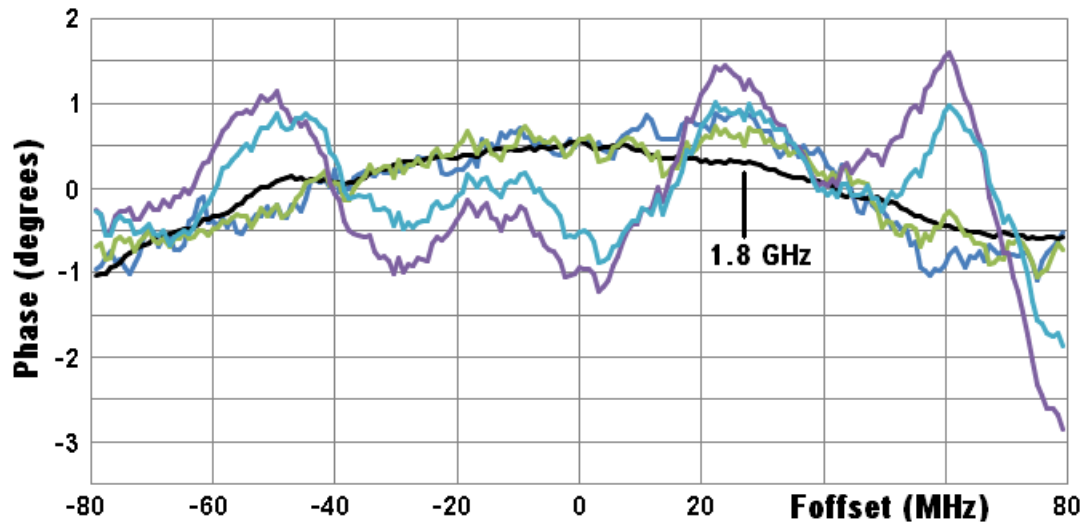

- a. Signal frequencies above 18 GHz are prone to response errors due to modes in the Type-N connector. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. These modes cause nominally up to -0.35 dB amplitude change, with phase errors of nominally up to ±1.2°.
- b. The listed performance is the rms of the phase deviation relative to the mean phase deviation from a linear phase condition, where the rms is computed across the span shown.
- c. Option MPB is installed and enabled.

Nominal IF Phase Linearity [Plot] 140 MHz IF Path

The phase characteristics of analysis frequencies below 3.6 GHz are similar to the 1.8 GHz graph shown. For analysis above 3.6 GHz, the curves shown are representative. They were measured between 5 and 25 GHz. The phase linearity of the analyzer does not depend on the frequency option.

Nominal IF Phase Linearity [Plot] 160 MHz IF Path

The phase characteristics of analysis frequencies below 3.6 GHz are similar to the 1.8 GHz graph shown. For analysis above 3.6 GHz, the curves shown are representative. They were measured between 5 and 25 GHz. The phase linearity of the analyzer does not depend on the frequency option.

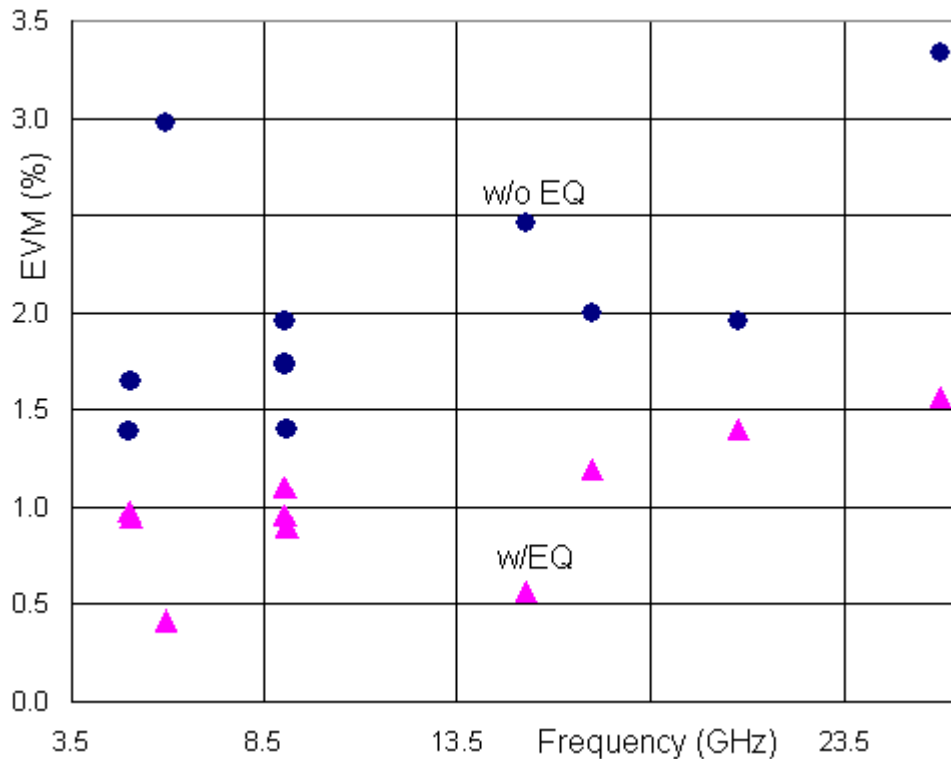

Option B85/B1X - 85/160 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description	Specification	Supplemental Information
<b>Full Scale (ADC Clipping)<sup>a</sup></b>		
Default settings, signal at CF (IF Gain = Low; IF Gain Offset = 0 dB)		
Band 0		–8 dBm mixer level <sup>b</sup> (nominal)
Band 1 through 6		–7 dBm mixer level <sup>b</sup> (nominal)
High Gain setting, signal at CF (IF Gain = High; IF Gain Offset = 0 dB)		
Band 0		–18 dBm mixer level <sup>b</sup> (nominal), subject to gain limitations <sup>c</sup>
Band 1 through 6		–17 dBm mixer level <sup>b</sup> (nominal), subject to gain limitations <sup>c</sup>
IF Gain Offset $\neq$ 0 dB, signal at CF		See formula <sup>d</sup> , subject to gain limitations <sup>c</sup>
Effect of signal frequency $\neq$ CF		up to $\pm 3$ dB (nominal)

- This table is meant to help predict the full-scale level, defined as the signal level for which ADC overload (clipping) occurs. The prediction is imperfect, but can serve as a starting point for finding that level experimentally. A SCPI command is also available for that purpose.
- Mixer level is signal level minus input attenuation.
- The available gain to reach the predicted mixer level will vary with center frequency. Combinations of high gains and high frequencies will not achieve the gain required, increasing the full scale level.
- The mixer level for ADC clipping is nominally given by that for the default settings, minus IF Gain Offset, minus 10 dB if IF Gain is set to High.

Option B85/B1X - 85/160 MHz Analysis Bandwidth  
Other Analysis Bandwidth Specifications

Description	Specification	Supplemental Information
<b>EVM measurement floor</b>  Case 1: 62.5 Msymbol/s, 16QAM signal, RRC filter alpha of 0.2, non-equalized, with approximately 75 MHz occupied bandwidth  Band 0, 1.8 GHz <sup>b</sup>  Band 1, 5.95 GHz <sup>b</sup>  Case 2: 104.167 Msymbol/s, 16QAM signal, RRC filter alpha of 0.35, with approximately 140 MHz occupied bandwidth		Customized settings required <sup>a</sup> , Preselector Bypassed (Option MPB)  0.8% (nominal)  1.1% (nominal)  See graph. Observations on one instrument shown for Bands 1 through 4, with and without equalization.

- a. EVM is evaluated using the N9064A VXA vector signal analyzer measurement application in the analyzer. This software selects input attenuation and preamplification indirectly. The selection usually optimizes signal-to-noise ratio, not EVM, biasing the results toward 0 dB input attenuation. With low input attenuation, the VSWR effects at the input across a 140 MHz bandwidth will dominate the EVM. Thus, very exacting setting of the Input Range control relative to the input signal level is required to get the best EVM and avoid the low attenuation problems. Recommended settings are these: For input signal levels between 0 and -14 dBm, use Input Range +4 dBm; for input signal levels between -14 and -24 dBm, use Input Range -2 dBm.
- b. The test frequency used was in the middle the band, and is representative of all of that band.

Description		Specifications	Supplemental Information
<b>Noise Density without Option MPB</b>			0 dB attenuation; center of IF bandwidth <sup>a</sup>
<b>Band</b>	<b>Freq (GHz)<sup>b</sup></b>		<b>Nominal</b>
0	1.80	-149 dBm/Hz	
1	5.95		-147 dBm/Hz
2	10.95		-146 dBm/Hz
3	15.30		-141 dBm/Hz
4	21.75		-138 dBm/Hz

- a. The noise level in the IF will change for frequencies away from the center of the IF. Usually, the IF part of the total noise will get worse by nominally up to 3 dB as the edge of the IF bandwidth is approached.
- b. Specifications apply at the center of each band. IF Noise dominates the system noise, therefore the noise density will not change substantially with center frequency.

Description		Specification	Supplemental Information
<b>Signal to Noise Ratio</b>			Ratio of clipping level <sup>a</sup> to noise level <sup>b</sup>
Example: 1.8 GHz			143 dB nominal, log averaged, 1 Hz RBW, IF Gain = Low, IF Gain Offset = 0 dB

- a. For the clipping level, see the table above, "Full Scale." Note that the clipping level is not a warranted specification, and has particularly high uncertainty at high microwave frequencies.
- b. The noise level is specified in the table above, "Displayed Average Noise Level." Please consider these details and additional information: DANL is, by Keysight and industry practice, specified with log averaging, which reduces the measured noise level by 2.51 dB. It is specified for a 1 Hz resolution bandwidth, which will nominally have a noise bandwidth of 1.056 Hz. Therefore, the noise density is 2.27 dB above the DANL. Please note that the signal-to-noise ratio can be further improved by using negative settings of IF Gain Offset.

## Data Acquisition

Description	Specifications		Supplemental Information
<b>Time Record Length</b>			
IQ Analyzer	4,000,000 IQ sample pairs		Waveform measurement <sup>a</sup>
Advanced Tools	<b>Data Packing</b>		89600 VSA software or Fast Capture <sup>b</sup>
Length (IQ sample pairs)	536 MSa ( $2^{29}$ Sa)	268 MSa ( $2^{28}$ Sa)	2 GB total memory
<b>Maximum IQ Capture Time</b>	<b>Data Packing</b>		
(89600 VSA and Fast Capture)	<b>32-bit</b>	<b>64-bit</b>	Calculated by: Length of IQ sample pairs/Sample Rate (IQ Pairs) <sup>c</sup>
10 MHz IFBW	42.94 s	21.47 s	
25 MHz IFBW	17.17 s	8.58 s	
40 MHz IFBW	10.73 s	5.36 s	
85 MHz IFBW	5.05 s	2.53 s	
160 MHz IFBW	2.68 s	1.34 s	
Sample Rate (IQ Pairs)	$1.25 \times \text{IFBW}$		
<b>ADC Resolution</b>	14 bits		

- This can also be accessed with the remote programming command of "read:wav()?".
- This can only be accessed with the remote programming command of "init:fcap" in the IQ Analyzer (Basic) waveform measurement.
- For example, using 32-bit data packing at 10 MHz IF bandwidth (IFBW) the Maximum Capture Time is calculated using the formula: "Max Capture Time = ( $2^{29}$ )/(10 MHz  $\times$  1.25)".

Data Acquisition

## 8 Option BBA – Analog Baseband IQ (BBIQ) Inputs

This chapter contains specifications for the *Option BBA* (Baseband IQ) hardware. *Option BBA* is only compatible with *Options 503, 508, 513, and 526*.

## Frequency and Time

Description	Specifications	Supplemental Information
<b>Frequency Range</b>		
I only, Q only	DC to 40 MHz	Tuning range <sup>a</sup>
I + jQ	-40 MHz to 40 MHz	Baseband range
<b>Frequency Span<sup>b</sup></b>		Dependent on base instrument IF BW options
I only, Q only		
Standard Instrument	10 Hz to 10 MHz	
With Option B25	10 Hz to 25 MHz	
With Option B40	10 Hz to 40 MHz	
I + jQ		
Standard Instrument	10 Hz to 20 MHz	
With Option B25	10 Hz to 50 MHz	
With Option B40	10 Hz to 80 MHz	
2-channel with 89600 VSA		
Standard Instrument	10 Hz to 10 MHz per channel	
With Option B25		
Zoom, complex data	10 Hz to 25 MHz per channel	
Baseband	10 Hz to 20 MHz per channel	
With Option B40		
Zoom, complex data	10 Hz to 40 MHz per channel	
Baseband	10 Hz to 20 MHz per channel	
<b>Frequency Resolution</b>	1 Hz	

- a. Closest approach of center frequency to edge frequency is limited to one-half of span.  
b. Standard base instrument provides 0 Hz to 10 MHz span range. For >10 MHz spans, options B25 (25 MHz) or B40 (40 MHz) required.

## Amplitude Accuracy and Range

Description	Specifications	Supplemental Information
<b>Input Ranges</b>		50 $\Omega$ source power setting for full-scale sinusoid

## Inputs/Outputs

Description	Specifications	Supplemental Information
Connectors (I, Q, I, Q, and Cal Out)	BNC female	See Frequency and Amplitude sections for Baseband Input details
Cal Out		
Signal	AC coupled square wave	
Frequency	Selectable between 1 kHz or 250 kHz (fixed)	
Input Impedance (4 connectors: I, I and Q, Q)		50 $\Omega$ or 1 M $\Omega$ (nominal) selectable
Probes Supported	Keysight InfiniiMax series:	Probe connectivity kits such as E2668A, E2669A or E2675A are needed. For more details, please refer to the Keysight probe configuration guides: 5968-7141EN and 5989-6162EN.
Active Probe	1130A, 1131A, 1132A, 1134A	
Passive Probe	1161A	
Input Return Loss		
(50 $\Omega$ Impedance Selected)		
0 to 10 MHz		-35 dB (nominal)
10 to 40 MHz		-30 dB (nominal)
Input Capacitance		12 pF (nominal)
(1 M $\Omega$ Input Impedance)		

## Option BBA - Analog Baseband IQ (BBIQ) Inputs Inputs/Outputs

## 9 Option CR3 – Connector Rear, 2nd IF Output

This chapter contains specifications for *Option CR3*, Connector Rear, 2nd IF Output.

## Specifications Affected by Connector Rear, 2nd IF Output

No other analyzer specifications are affected by the presence or use of this option. New specifications are given in the following page.

## Other Connector Rear, 2nd IF Output Specifications

### Aux IF Out Port

Description	Specifications	Supplemental Information
Connector	SMA female	Shared with other options
Impedance		50 $\Omega$ (nominal)

### Second IF Out

Description	Specifications	Supplemental Information
<b>Second IF Out</b>		
Output Center Frequency		
SA Mode		322.5 MHz
I/Q Analyzer Mode		
IF Path $\leq 25$ MHz		322.5 MHz
IF Path 40 MHz		250 MHz
IF Path 160 MHz		300 MHz
Conversion Gain at 2nd IF output center frequency		-1 to +4 dB (nominal) plus RF frequency response <sup>a</sup>
Bandwidth		
Low band		Up to 160 MHz (nominal) <sup>b</sup>
High band		
With preselector		Depends on RF center frequency <sup>c</sup>
Preselector bypassed ( <i>Option MPB</i> )		Up to 700 MHz nominal <sup>d</sup>
Residual Output Signals		-94 dBm or lower (nominal)

- "Conversion Gain" is defined from RF input to IF Output with 0 dB mechanical attenuation and the electronic attenuator off. The nominal performance applies in zero span.
- The passband width at -3 dB nominally extends from IF frequencies of 230 to 370 MHz. The passband width is thus maximum and symmetric when using 300 MHz as the IF output center frequency. When the IF path in use is centered at a frequency different from 300 MHz, the passband will be asymmetric.
- The YIG-tuned preselector bandwidth nominally varies from 55 MHz for a center frequencies of 3.6 GHz through 57 MHz at 15 GHz to 75 MHz at 26.5 GHz. The preselector effect will dominate the passband width.
- The passband width at -6 dB nominally extends from 100 to 800 MHz. Thus, the maximum width is not centered around the IF output center frequency. Expandable to 900 MHz with Corrections.

Option CR3 - Connector Rear, 2nd IF Output  
Other Connector Rear, 2nd IF Output Specifications

## 10 Option CRP – Connector Rear, Arbitrary IF Output

This chapter contains specifications for *Option CRP*, Connector Rear, Arbitrary IF Output.

## Specifications Affected by Connector Rear, Arbitrary IF Output

No other analyzer specifications are affected by the presence or use of this option. New specifications are given in the following page.

## Other Connector Rear, Arbitrary IF Output Specifications

### Aux IF Out Port

Description	Specifications	Supplemental Information
Connector	SMA female	Shared with other options
Impedance		50 $\Omega$ (nominal)

### Arbitrary IF Out

Description	Specifications	Supplemental Information
<b>Arbitrary IF Out</b>		
IF Output Center Frequency		
Range	10 to 75 MHz	
Resolution	0.5 MHz	
Conversion Gain at the RF Center Frequency		-1 to +4 dB (nominal) plus RF frequency response <sup>a</sup>
Bandwidth		
Highpass corner frequency		5 MHz (nominal) at -3 dB
Lowpass corner frequency		120 MHz (nominal) at -3 dB
Output at 70 MHz center		
Low band; also, high band with preselector bypassed		100 MHz (nominal) <sup>b</sup>
Preselected bands		Depends on RF center frequency <sup>c</sup>
Lower output frequencies		Subject to folding <sup>d</sup>
Phase Noise		Added noise above analyzer noise <sup>e</sup>
Residual Output Signals		-88 dBm or lower (nominal) <sup>f</sup>

- "Conversion Gain" is defined from RF input to IF Output with 0 dB mechanical attenuation and the electronic attenuator off. The nominal performance applies with zero span.
- The bandwidth shown is in non-preselected bands. The combination with preselection (see footnote c) will reduce the bandwidth.
- See **"Preselector Bandwidth" on page 31**.
- As the output center frequency declines, the lower edge of the passband will fold around zero hertz. This phenomenon is most severe for output frequencies around and below 20 MHz. For more information on frequency folding, refer to *X-Series Spectrum Analyzer User's and Programmer's Reference*.
- The added phase noise in the conversion process of generating this IF is nominally -88, -106, and -130 dBc/Hz at offsets of 10, 100, and 1000 kHz respectively.
- Measured from 1 MHz to 150 MHz.

Option CRP - Connector Rear, Arbitrary IF Output  
Other Connector Rear, Arbitrary IF Output Specifications

## 11 Option EA3 – Electronic Attenuator, 3.6 GHz

This chapter contains specifications for the *Option EA3* Electronic Attenuator, 3.6 GHz.

## Specifications Affected by Electronic Attenuator

Specification Name	Information
Frequency Range	See <b>“Range (Frequency and Attenuation)” on page 175.</b>
1 dB Gain Compression Point	See <b>“Distortions and Noise” on page 176.</b>
Displayed Average Noise Level	See <b>“Distortions and Noise” on page 176.</b>
Frequency Response	See <b>“Frequency Response” on page 177.</b>
Attenuator Switching Uncertainty	The recommended operation of the electronic attenuator is with the reference setting (10 dB) of the mechanical attenuator. In this operating condition, the Attenuator Switching Uncertainty specification of the mechanical attenuator in the core specifications does not apply, and any switching uncertainty of the electronic attenuator is included within the <b>“Electronic Attenuator Switching Uncertainty” on page 179.</b>
Absolute Amplitude Accuracy,	See <b>“Absolute Amplitude Accuracy” on page 178.</b>
Second Harmonic Distortion	See <b>“Distortions and Noise” on page 176.</b>
Third Order Intermodulation Distortion	See <b>“Distortions and Noise” on page 176.</b>

## Other Electronic Attenuator Specifications

Description	Specifications	Supplemental Information
<b>Range (Frequency and Attenuation)</b>		
Frequency Range	3 Hz to 3.6 GHz	
Attenuation Range		
Electronic Attenuator Range	0 to 24 dB, 1 dB steps	
Calibrated Range	0 to 24 dB, 2 dB steps	Electronic attenuator is calibrated with 10 dB mechanical attenuation
Full Attenuation Range	0 to 94 dB, 1 dB steps	Sum of electronic and mechanical attenuation

Option EA3 – Electronic Attenuator, 3.6 GHz  
Other Electronic Attenuator Specifications

Description	Specifications	Supplemental Information
Distortions and Noise		When using the electronic attenuator, the mechanical attenuator is also in-circuit. The full mechanical attenuator range is available <sup>a</sup> .
1 dB Gain Compression Point		The 1 dB compression point will be nominally higher with the electronic attenuator “Enabled” than with it not Enabled by the loss, <sup>b</sup> except with high settings of electronic attenuation <sup>c</sup> .
Displayed Average Noise Level		Instrument Displayed Average Noise Level will nominally be worse with the electronic attenuator “Enabled” than with it not Enabled by the loss <sup>b</sup> .
Second Harmonic Distortion		Instrument Second Harmonic Distortion will nominally be better in terms of the second harmonic intercept (SHI) with the electronic attenuator “Enabled” than with it not Enabled by the loss <sup>b</sup> .
Third-order Intermodulation Distortion		Instrument TOI will nominally be better with the electronic attenuator “Enabled” than with it not Enabled by the loss <sup>b</sup> except for the combination of high attenuation setting and high signal frequency <sup>d</sup> .

- The electronic attenuator is calibrated for its frequency response only with the mechanical attenuator set to its preferred setting of 10 dB.
- The loss of the electronic attenuator is nominally given by its attenuation plus its excess loss. That excess loss is nominally 2 dB from 0 – 500 MHz and increases by nominally another 1 dB/GHz for frequencies above 500 MHz.
- An additional compression mechanism is present at high electronic attenuator settings. The mechanism gives nominally 1 dB compression at +20 dBm at the internal electronic attenuator input. The compression threshold at the RF input is higher than that at the internal electronic attenuator input by the mechanical attenuation. The mechanism has negligible effect for electronic attenuations of 0 through 14 dB.
- The TOI performance improvement due to electronic attenuator loss is limited at high frequencies, such that the TOI reaches a limit of nominally +45 dBm at 3.6 GHz, with the preferred mechanical attenuator setting of 10 dB, and the maximum electronic attenuation of 24 dB. The TOI will change in direct proportion to changes in mechanical attenuation.

Option EA3 – Electronic Attenuator, 3.6 GHz  
Other Electronic Attenuator Specifications

Description	Specifications	Supplemental Information
<b>Absolute Amplitude Accuracy</b>  At 50 MHz <sup>a</sup> 20 to 30°C Full temperature range  At all frequencies <sup>a</sup> 20 to 30°C Full temperature range  95th Percentile Absolute Amplitude Accuracy <sup>b</sup>  (Wide range of signal levels, RBWs, RLs, etc., 0.01 to 3.6 GHz)	$\pm 0.24$ dB $\pm 0.32$ dB  $\pm(0.24 \text{ dB} + \text{frequency response})$ $\pm(0.32 \text{ dB} + \text{frequency response})$	$\pm 0.13$ dB(95th percentile)        $\pm 0.21$ dB

- a. Absolute amplitude accuracy is the total of all amplitude measurement errors, and applies over the following subset of settings and conditions:  $1 \text{ Hz} \leq \text{RBW} \leq 1 \text{ MHz}$ ; Input signal  $-10$  to  $-50$  dBm; Input attenuation 10 dB; all settings auto-coupled except Swp Time Rules = Accuracy; combinations of low signal level and wide RBW use VBW  $\leq 30$  kHz to reduce noise. When using FFT sweeps, the signal must be at the center frequency.

This absolute amplitude accuracy specification includes the sum of the following individual specifications under the conditions listed above: Scale Fidelity, Reference Level Accuracy, Display Scale Switching Uncertainty, Resolution Bandwidth Switching Uncertainty, 50 MHz Amplitude Reference Accuracy, and the accuracy with which the instrument aligns its internal gains to the 50 MHz Amplitude Reference.

- b. Absolute Amplitude Accuracy for a wide range of signal and measurement settings, covers the 95th percentile proportion with 95% confidence. Here are the details of what is covered and how the computation is made: The wide range of conditions of RBW, signal level, VBW, reference level and display scale are discussed in footnote a. There are 44 quasi-random combinations used, tested at a 50 MHz signal frequency. We compute the 95th percentile proportion with 95% confidence for this set observed over a statistically significant number of instruments. Also, the frequency response relative to the 50 MHz response is characterized by varying the signal across a large number of quasi-random verification frequencies that are chosen to not correspond with the frequency response adjustment frequencies. We again compute the 95th percentile proportion with 95% confidence for this set observed over a statistically significant number of instruments. We also compute the 95th percentile accuracy of tracing the calibration of the 50 MHz absolute amplitude accuracy to a national standards organization. We also compute the 95th percentile accuracy of tracing the calibration of the relative frequency response to a national standards organization. We take the root-sum-square of these four independent Gaussian parameters. To that rss we add the environmental effects of temperature variations across the 20 to 30°C range. These computations and measurements are made with the mechanical attenuator, set to the reference state of 10 dB, the electronic attenuator set to all even settings from 4 through 24 dB inclusive.

Option EA3 – Electronic Attenuator, 3.6 GHz  
Other Electronic Attenuator Specifications

Description	Specifications	Supplemental Information
<b>Electronic Attenuator Switching Uncertainty</b>  (Error relative to reference condition: 50 MHz, 10 dB mechanical attenuation, 10 dB electronic attenuation)  Attenuation = 0 dB  3 Hz to 3.6 GHz  Attenuation to 24 dB  3 Hz to 3.6 GHz	See note <sup>a</sup>	±0.04 dB (nominal)  ±0.04 dB (nominal)

- a. The specification is  $\pm 0.14$  dB; typically 0.03 dB. Note that this small relative uncertainty does not apply in estimating absolute amplitude accuracy, because it is included within the absolute amplitude accuracy for measurements done with the electronic attenuator. (Measurements made without the electronic attenuator are treated differently; the absolute amplitude accuracy specification for those measurements does not include attenuator switching uncertainty.)

Option EA3 - Electronic Attenuator, 3.6 GHz  
Other Electronic Attenuator Specifications

## 12 Option EMC – Precompliance EMI Features

This chapter contains specifications for the *Option EMC* precompliance EMI features.

## Frequency

Description	Specifications	Supplemental information
<b>Frequency Range</b>		10 Hz to 3.6, 7, 13.6, 26.5, 44, or 50 GHz depending on the frequency option.
<b>EMI Resolution Band widths</b>		See <b>“CISPR Preset Settings” on page 183</b> and <b>“MIL-STD 461D/E/F Frequency Ranges and Band widths” on page 183</b> for CISPR and MIL-STD frequency ranges.
CISPR		Available when the EMC Standard is CISPR.
200 Hz, 9 kHz, 120 kHz, 1 MHz		Meet CISPR standard <sup>a</sup> , –6 dB bandwidths, subject to masks
Non-CISPR bandwidths	10, 30, 100, 300 Hz, 1, 3, 30, 300 kHz, 3, 10 MHz	–6 dB bandwidths
MIL STD		Available when the EMC Standard is MIL
10, 100 Hz, 1, 10, 100 kHz, 1 MHz		Meets MIL-STD <sup>b</sup> , –6 dB bandwidths
Non-MIL STD bandwidths	30, 300 Hz, 3, 30, 300 kHz, 3, 10 MHz	–6 dB bandwidths

a. CISPR 16-1-1(2010)

b. MIL-STD 461 D/E/F (20 Aug. 1999)

**Table 12-1 CISPR Preset Settings**

CISPR Band	Frequency Range	CISPR RBW	Data Points
Band A	9 to 150 kHz	200 Hz	1413
Band B	150 kHz to 30 MHz	9 kHz	6637
Band C	30 to 300 MHz	120 kHz	4503
Band D	300 MHz to 1 GHz	120 kHz	11671
Band C/D	30 MHz to 1 GHz	120 kHz	16171
Band E	1 to 18 GHz	1 MHz	34001

**Table 12-2 MIL-STD 461D/E/F Frequency Ranges and Bandwidths**

Frequency Range	6 dB Bandwidth	Minimum Measurement Time
30 Hz to 1 kHz	10 Hz	0.015 s/Hz
1 kHz to 10 kHz	100 Hz	0.15 s/kHz
10 kHz to 150 kHz	1 kHz	0.015 s/kHz
150 kHz to 30 MHz	10 kHz	1.5 s/MHz
30 MHz to 1 GHz	100 kHz	0.15 s/MHz
Above 1 GHz	1 MHz	15 s/GHz

## Amplitude

Description	Specifications	Supplemental Information
<b>EMI Average Detector</b>		Used for CISPR-compliant average measurements and, with 1 MHz RBW, for frequencies above 1 GHz
Default Average Type		All filtering is done on the linear (voltage) scale even when the display scale is log.
<b>Quasi-Peak Detector</b>		Used with CISPR-compliant RBWs, for frequencies $\leq 1$ GHz
Absolute Amplitude Accuracy for reference spectral intensities		Meets CISPR standards <sup>a</sup>
Relative amplitude accuracy versus pulse repetition rate		Meets CISPR standards <sup>a</sup>
Quasi-Peak to average response ratio		Meets CISPR standards <sup>a</sup>
Dynamic range		
Pulse repetition rates $\geq 20$ Hz		Meets CISPR standards <sup>a</sup>
Pulse repetition rates $\leq 10$ Hz		Does not meet CISPR standards in some cases with DC pulse excitation.
<b>RMS Average Detector</b>		Meets CISPR standards <sup>a</sup>

a. CISPR 16-1-1 (2010)

## 13 Option ESC – External Source Control

This chapter contains specifications for the *Option ESC*, External Source Control.

E8267D-544	250 kHz to 44 GHz	

Option ESC - External Source Control  
General Specifications

Description	Specification	Supplemental Information
<b>Span Limitations</b> Span limitations due to source range  <b>Offset Sweep</b> Sweep offset setting range  Sweep offset setting resolution  <b>Harmonic Sweep</b> Harmonic sweep setting range <sup>a</sup> Multiplier numerator Multiplier denominator  <b>Sweep Direction</b> <sup>b</sup>	1 Hz	Limited by the source and SA operating range   Limited by the source and SA operating range   N = 1 to 1000 N = 1 to 1000  Normal, Reversed

a. Limited by the frequency range of the source to be controlled.

b. The analyzer always sweeps in a positive direction, but the source may be configured to sweep in the opposite direction. This can be useful for analyzing negative mixing products in a mixer under test, for example.

Option ESC - External Source Control  
General Specifications

Description	Specification	Supplemental Information
<b>Dynamic Range</b> (10 MHz to 3 GHz, Input terminated, sample detector, average type = log, 20 to 30°C)		Dynamic Range = −10 dBm − DANL − 10×log(RBW) <sup>a</sup>
<b>SA span</b>	<b>SA RBW</b>	
1 MHz	2 kHz	108.0 dB
10 MHz	6.8 kHz	102.7 dB
100 MHz	20 kHz	98.0 dB
1000 MHz	68 kHz	92.7 dB
<b>Amplitude Accuracy</b>		Multiple contributors <sup>b</sup> Linearity <sup>c</sup> Source and Analyzer Flatness <sup>d</sup> YTF Instability <sup>e</sup> VSWR effects <sup>f</sup>

- The dynamic range is given by this computation:  $-10 \text{ dBm} - \text{DANL} - 10 \times \log(\text{RBW})$  where DANL is the displayed average noise level specification, normalized to 1 Hz RBW, and the RBW used in the measurement is in hertz units. The dynamic range can be increased by reducing the RBW at the expense of increased sweep time.
- The following footnotes discuss the biggest contributors to amplitude accuracy.
- One amplitude accuracy contributor is the linearity with which amplitude levels are detected by the analyzer. This is called "scale fidelity" by most spectrum analyzer users, and "dynamic amplitude accuracy" by most network analyzer users. This small term is documented in the Amplitude section of the Specifications Guide. It is negligibly small in most cases.
- The amplitude accuracy versus frequency in the source and the analyzer can contribute to amplitude errors. This error source is eliminated when using normalization in low band (0 to 3.6 GHz). In high band the gain instability of the YIG-tuned prefilter in the analyzer keeps normalization errors nominally in the 0.25 to 0.5 dB range.
- In the worst case, the center frequency of the YIG-tuned prefilter can vary enough to cause very substantial errors, much higher than the nominal 0.25 to 0.5 dB nominal errors discussed in the previous footnote. In this case, or as a matter of good practice, the prefilter should be centered. See the user's manual for instructions on centering the preselector.
- VSWR interaction effects, caused by RF reflections due to mismatches in impedance, are usually the dominant error source. These reflections can be minimized by using 10 dB or more attenuation in the analyzer, and using well-matched attenuators in the measurement configuration.

Description	Specification	Supplemental Information

- Firmware revision A.14.50 or later is required for the signal analyzer to control the microwave X-Series EXG (N5173B) and MXG (N5183B).

## 14 Option EXM – External Mixing

This chapter contains specifications for the *Option EXM* External Mixing.

## Specifications Affected by External mixing

Specification Name	Information
RF-Related Specifications, such as TOI, DANL, SHI, Amplitude Accuracy, and so forth.	Specifications do not apply; some related specifications are contained in IF Input in this chapter
IF-Related Specifications, such as RBW range, RBW accuracy, RBW switching uncertainty, and so forth.	Specifications unchanged, except IF Frequency Response - see specifications in this chapter.
New specifications: IF Input Mixer Bias LO Output	See specifications in this chapter.

## Other External Mixing Specifications

Description		Specifications	Supplemental Information
<b>Connection Port EXT MIXER</b>			
Connector		SMA, female	
Impedance			50 $\Omega$ (nominal) at IF and LO frequencies
Functions		Triplexed for Mixer Bias, IF Input and LO output	
<b>Mixer Bias</b>			
Bias Current			Short circuit current
Range		$\pm 10$ mA	
Resolution		10 $\mu$ A	
Accuracy			$\pm 20$ $\mu$ A (nominal)
Output impedance			477 $\Omega$ (nominal)
Bias Voltage			Open circuit
Range			$\pm 3.7$ V (nominal)
<b>IF Input</b>			
Maximum Safe Level		+7 dBm	
Center Frequency			
IF BW $\leq 25$ MHz		322.5 MHz	includes swept
40 MHz IF path		250.0 MHz	
85 through 160 MHz paths		300.0 MHz	
Bandwidth			Supports all optional IFs
ADC Clipping Level <sup>a</sup>			-14.5 $\pm$ 1.5 dBm (nominal)
1 dB Gain Compression <sup>a</sup>			-2 dBm (nominal)
Gain Accuracy <sup>b</sup>		20 to 30°C      Full Range	
IF BW $\leq 25$ MHz		$\pm 1.2$ dB $\pm 2.5$ dB	
Wider IF BW			$\pm 1.2$ dB (nominal)

Option EXM - External Mixing  
Other External Mixing Specifications

Description		Specifications	Supplemental Information
IF Frequency Response			RMS (nominal)
<b>CF</b>	<b>Width</b>		
322.5 MHz	±5 MHz		0.05 dB
322.5 MHz	±12.5 MHz		0.07 dB
250 MHz	±20 MHz		0.15 dB
300 MHz	±80 MHz		0.5 dB
Noise Figure (322.5 MHz, swept operation)			9 dB (nominal)
VSWR			1.3:1 (nominal)

- These specifications apply at the IF input port. The on-screen and mixer-input levels scale with the conversion loss and corrections values.
- The amplitude accuracy of a measurement includes this term and the accuracy with which the settings of corrections model the loss of the external mixer.

Description	Specifications		Supplemental Information
<b>LO Output</b>			
Frequency Range	3.75 to 14.1 GHz		
Output Power <sup>a</sup>	<b>20 to 30°C</b>	<b>Full Range</b>	
3.75 to 7.0 GHz <sup>b</sup>	+15.0 to 18.0 dBm	+14.5 to 18.5 dBm	
7.0 to 8.72 GHz <sup>b</sup>	+15.0 to 18.0 dBm	+13.5 to 18.8 dBm	
7.8 to 14.1 GHz <sup>c</sup>	+14.0 to 18.5 dBm	Not specified	
Second Harmonic			-20 dB (nominal)
Fundamental Feedthrough and Undesired Harmonics <sup>c</sup>			-15 dB (nominal)
VSWR			<2.2:1 (nominal)

- The LO output port power is compatible with Keysight M1970 and 11970 Series mixers except for the 11970K. The power is specified at the connector. Cable loss will affect the power available at the mixer. With non-Keysight mixer units, supplied loss calibration data may be valid only at a specified LO power that may differ from the power available at the mixer. In such cases, additional uncertainties apply.
- LO Doubler = Off settings.
- LO Doubler = On setting. Fundamental frequency = 3.9 to 7.0 GHz.

## 15 Option LNP – Low Noise Path Specifications

This chapter contains specifications for the *Option LNP*, Low Noise Path.

## Specifications Affected by Low Noise Path

The low noise path is in use when all the following are true:

- The LNP option is licensed
- The setting of the Microwave Path is "Low Noise Path Enabled"
- The start frequency is at least 3.5 GHz and the stop frequency is above 3.6 GHz
- The preamp is either not licensed, or set to Off, or set to "Low Band"

Specification Name	Information
Displayed Average Noise Level (DANL)	See specifications in this chapter
Compression	Little change in dynamic range <sup>a</sup>
VSWR	The magnitude will be very similar between LNP and non-LNP operation, but the details, such as the frequencies of the peaks and valleys, will shift.
Frequency Response	See specifications in this chapter. The specifications are very similar to the normal path. But the details of the response can be quite different, with the frequencies of the peaks and valleys shifting between LNP and non-LNP operation. That means that any relative measurements between, for example, a large signal measured without LNP, and a small signal measured with LNP, could be subject to relative frequency response errors as large as the sum of the individual errors.
Second Harmonic Distortion	See specifications in this chapter <sup>b</sup>
Third-Order Intermodulation	Little change in dynamic range <sup>a</sup>
Other Input Related Spurious	See <b>"Spurious Responses" on page 55</b> of the core specifications. This performance with LNP is not warranted, but is nominally the same as non-LNP performance.

- a. The low noise path, when in use, does not substantially change the compression-to-noise dynamic range or the TOI-to-noise dynamic range because it mostly just reduces losses in the signal path in front of all significant noise, TOI and compression-affecting circuits. In other words, the compression threshold and the third-order intercept both decrease, and to the same extent as that to which the DANL decreases.
- b. Unlike the case for TOI and compression, the low noise path does provide a substantial improvement in the second-harmonic performance. The low noise path bypasses electronic switching elements that otherwise dominate harmonic distortion, including second harmonic distortion.

## Displayed Average Noise Level

37 to 46 GHz		x	-140 dBm	-136 dBm	-145 dBm
46 to 50 GHz		x	-138 dBm	-134 dBm	-142 dBm

Option LNP - Low Noise Path Specifications  
Displayed Average Noise Level

- a. DANL for zero span and swept is normalized in two ways and for two reasons. DANL is measured in a 1 kHz RBW and normalized to the narrowest available RBW, because the noise figure does not depend on RBW and 1 kHz measurements are faster. The second normalization is that DANL is measured with 10 dB input attenuation and normalized to the 0 dB input attenuation case, because that makes DANL and third order intermodulation test conditions congruent, allowing accurate dynamic range estimation for the analyzer.

Description	Specifications		Supplemental Information	
<b>DANL (with Noise Floor Extension) Improvement<sup>a</sup></b>			<b>95th Percentile (<math>\approx 2\sigma</math>)</b>	
			<b>Freq Option <math>\leq 526</math></b>	<b>Freq Option <math>&gt; 526</math></b>
Band 1			10 dB	10 dB
Band 2			10 dB	9 dB
Band 3			10 dB	10 dB
Band 4			10 dB	11 dB
Band 5			N/A	12 dB
Band 6			N/A	11 dB
<b>Examples<sup>b</sup> of Effective DANL<sup>c</sup></b> (18 to 30°C)	<b>Freq Option <math>\leq 526</math></b>	<b>Freq Option <math>&gt; 526</math></b>		
Mid-Band 1 (5.9 GHz)	-162 dBm	-157 dBm		
Mid-Band 2 (10.95 GHz)	-162 dBm	-157 dBm		
Mid-Band 3 (15.3 GHz)	-160 dBm	-157 dBm		
Mid-Band 4 (21.75 GHz)	-160 dBm	-157 dBm		
Mid-Band 5 (30.4 GHz)	N/A	-157 dBm		
Mid-Band 6 (42.7 GHz)	N/A	-150 dBm		

- a. This statement on the improvement in DANL is based on the accuracy of the fit of the noise floor model to the measured values of that noise. This measure of the performance correlates well with improvement versus frequency. The improvement actually measured and specified in "Examples of Effective DANL" usually meet these limits as well, but not with the confidence in some cases.
- b. The noise is evaluated only at a frequency given by the center of the band plus pi times 1 MHz. (We use an irrational offset from exactly midband to reduce the risk of uncovering residual responses at round-numbered frequencies, such as integer multiples of the 10 MHz reference frequency.) The center of the band is chosen because it is a highly representative frequency in the band. It is not worst-case, and usually better than the average case.
- c. "Effective DANL" is the DANL which would give equivalent amplitude errors to those observed with a signal about 4 dB above the uncompensated noise floor. Effective DANL can be a positive or negative amount of power; the expressed specifications are of the absolute value of that Effective DANL. Effective DANL is verified with measurement settings that are best for low level measurements, which is with the average detector, with Average Type = Power, and very large amounts of averaging.

Option LNP - Low Noise Path Specifications  
Displayed Average Noise Level

Description		Specifications		Supplemental Information
<b>Frequency Response</b> (Maximum error relative to reference condition (50 MHz) Swept operation <sup>a</sup> , Attenuation 10 dB)				Refer to the footnote for <b>Band Overlaps on page 20</b> . Freq <i>Option 526</i> only: Modes above 18 GHz <sup>b</sup>
<i>mmW (Option 543, 544, or 550)</i>				
<i>RF/μW (Option 508, 513, or 526)</i>				
		<b>20 to 30°C</b>	<b>Full range</b>	<b>95th Percentile (≈2σ)</b>
3.5 to 5.2 GHz	x	±1.5 dB	±2.5 dB	±0.63 dB
3.5 to 5.2 GHz		±1.9dB	±3.7 dB	±0.78 dB
5.2 to 8.4 GHz	x	±1.5 dB	±2.5 dB	±0.63 dB
5.2 to 8.4 GHz		±1.5 dB	±2.5 dB	±0.62 dB
8.3 to 13.6 GHz	x	±2.0 dB	±2.7 dB	±0.57 dB
8.3 to 13.6 GHz		±2.0 dB	±2.7 dB	±0.61 dB
13.5 to 17.1 GHz	x	±2.0 dB	±2.7 dB	±0.62 dB
13.5 to 17.1 GHz		±2.0 dB	±2.7 dB	±0.68 dB
17.0 to 22.0 GHz	x	±2.0 dB	±2.7 dB	±0.77 dB
17.0 to 22.0 GHz		±2.0 dB	±2.7 dB	±0.72 dB
22.0 to 26.5 GHz	x	±2.5 dB	±3.7 dB	±0.86 dB
22.0 to 26.5 GHz		±2.5 dB	±3.7 dB	±0.71 dB
26.4 to 34.5 GHz	x	±2.3 dB	±3.5 dB	±0.95 dB
34.4 to 50 GHz	x	±3.2 dB	±5.0 dB	±1.31 dB

- a. For Sweep Type = FFT, add the RF flatness errors of this table to the IF Frequency Response errors. An additional error source, the error in switching between swept and FFT sweep types, is nominally ±0.01 dB and is included within the “Absolute Amplitude Error” specifications.
- b. Signal frequencies above 18 GHz are prone to response errors due to modes in the Type-N connector. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. The effect of these modes with this connector are included within these specifications.

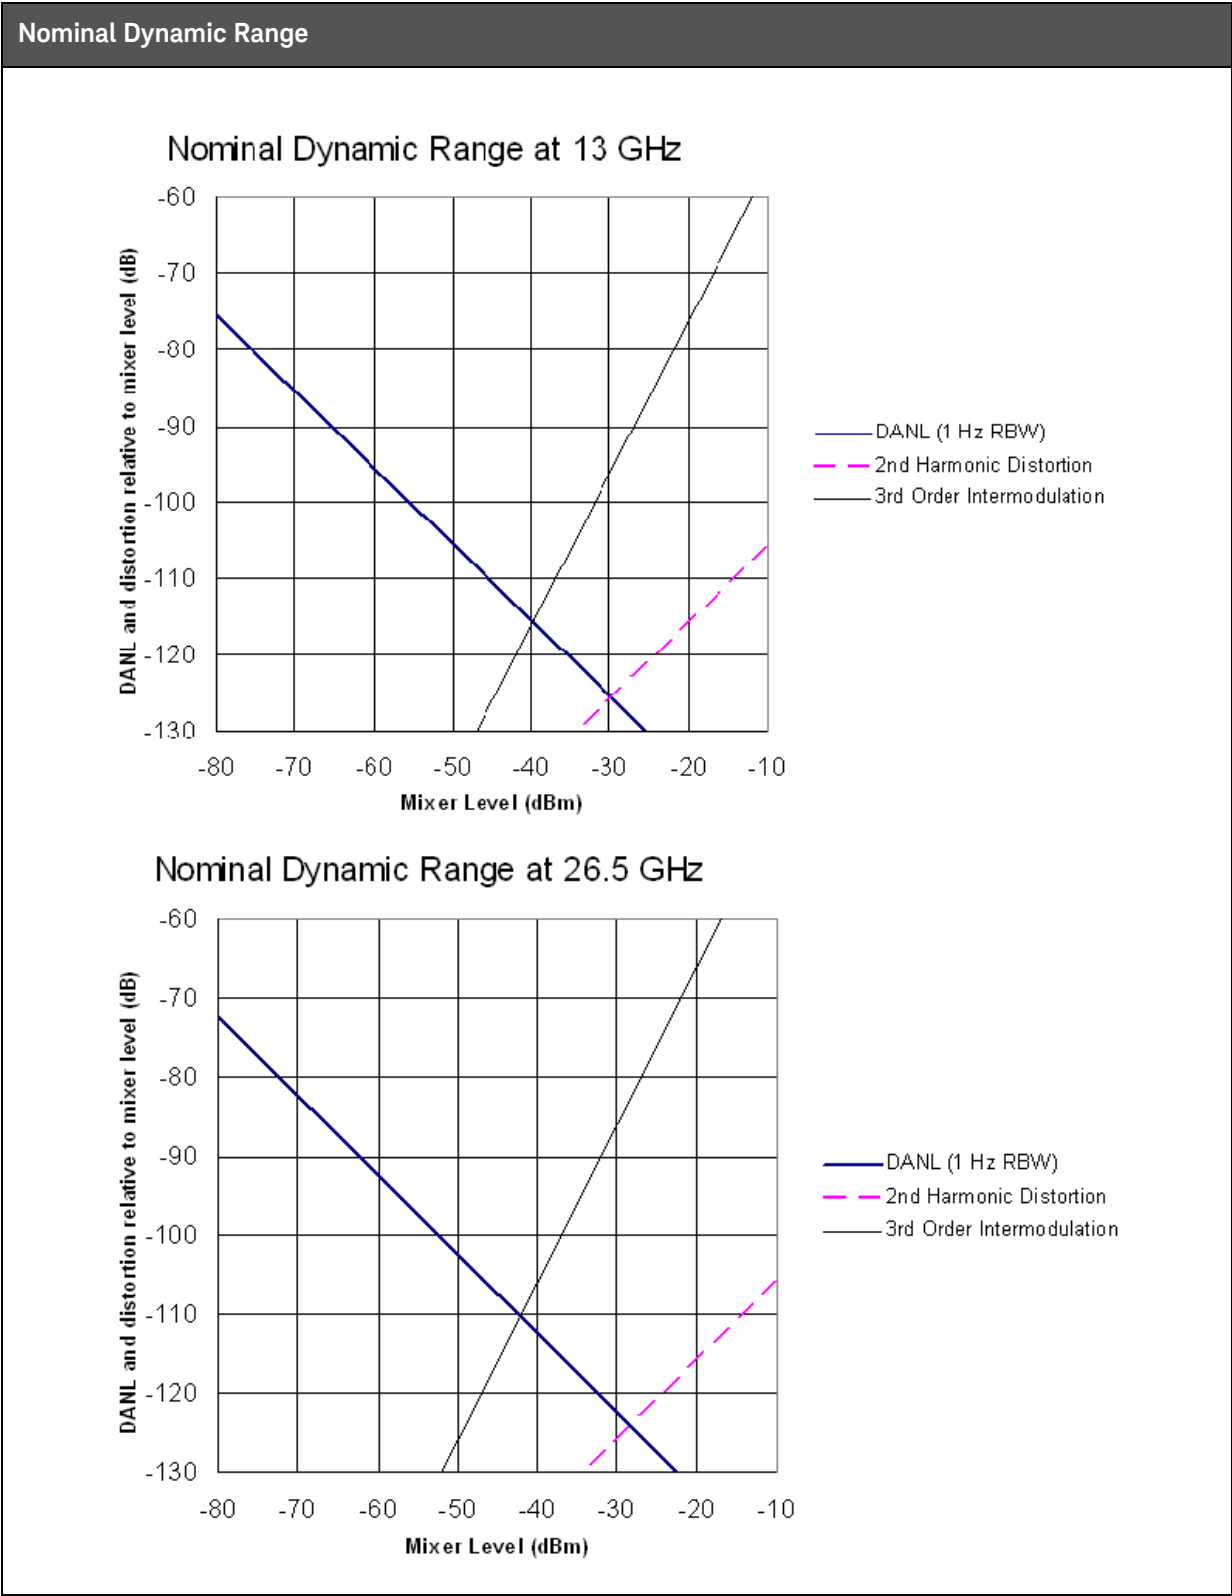

## Second Harmonic Distortion

Description	Specifications			Supplemental Information	
Second Harmonic Distortion	Mixer Level <sup>a</sup>	Distortion	SHI <sup>b</sup>	Distortion (nominal)	SHI <sup>b</sup> (nominal)
Source Frequency					
1.75 to 2.5 GHz	–15 dBm	–95 dBc	+80 dBm		
2.5 to 4 GHz					
Freq option ≤ 526	–15 dBm	–101 dBc	+86 dBm		
Freq option > 526	–15 dBm	–99 dBc	+84 dBm		
4 to 5 GHz					
Freq option ≤ 526	–15 dBm	–105 dBc	+90 dBm		
Freq option > 526	–15 dBm	–99 dBc	+84 dBm		
5 to 13.25 GHz	–15 dBm	–105 dBc	+90 dBm		
13.25 to 50 GHz	–15 dBm			–105 dBc	+90 dBm

a. Mixer level = Input Level – Input Attenuation

b. SHI = second harmonic intercept. The SHI is given by the mixer power in dBm minus the second harmonic distortion level relative to the mixer tone in dBc.

# Dynamic Range Plots

Option LNP - Low Noise Path Specifications  
Dynamic Range Plots

## 16 Option MPB – Microwave Preselector Bypass

This chapter contains specifications for the *Option MPB*, Microwave Preselector Bypass.

## Specifications Affected by Microwave Preselector Bypass

Specification Name	Information
Displayed Average Noise Level, without Preamp	.For analyzers with frequency <i>Option 526</i> (26.5 GHz) or lower: Performance is nominally 2 dB worse than without <i>Option MPB</i> . For analyzers with frequency option higher than <i>Option 526</i> (26.5 GHz): Performance is nominally 5 dB better noise floor than without <i>Option MPB</i> .
Displayed Average Noise Level, with Preamp	Performance is nominally 3 dB worse than without <i>Option MPB</i> .
IF Frequency Response and IF Phase Linearity	See <b>“IF Frequency Response” on page 37</b> and <b>“IF Phase Linearity” on page 38</b> for the standard 10 MHz analysis bandwidth; also, see the associated "Analysis Bandwidth" chapter for any optional bandwidths.
Frequency Response	See specifications in this chapter.
VSWR	The magnitude of the mismatch over the range of frequencies will be very similar between MPB and non-MPB operation, but the details, such as the frequencies of the peaks and valleys, will shift.
Additional Spurious Responses	In addition to the <b>“Spurious Responses” on page 55</b> of the core specifications, <b>“Additional Spurious Responses” on page 206</b> of this chapter also apply.

## Other Microwave Preselector Bypass Specifications

Description			Specifications		Supplemental Information
<b>Frequency Response</b> (Maximum error relative to reference condition (50 MHz) Swept operation <sup>a</sup> , Attenuation 10 dB)					Refer to the footnote for <b>Band Overlaps on page 20</b> . Freq <i>Option 526</i> only: Modes above 18 GHz <sup>b</sup>
<i>mmW (Option 543, 544, or 550)</i>					
<i>RF/μW (Option 508, 513, or 526)</i>					
		</			

- For Sweep Type = FFT, add the RF flatness errors of this table to the IF Frequency Response errors. An additional error source, the error in switching between swept and FFT sweep types, is nominally  $\pm 0.01$  dB and is included within the “Absolute Amplitude Error” specifications.
- Signal frequencies above 18 GHz are prone to response errors due to modes in the Type-N connector. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. The effect of these modes with this connector are included within these specifications.

Option MPB – Microwave Preselector Bypass  
Other Microwave Preselector Bypass Specifications

Description	Specifications	Supplemental Information
<b>Additional Spurious Responses<sup>a</sup></b>		
<b>Tuned Frequency (f)</b> <b>Excitation</b>		
Image Response		
3.5 to 50 GHz $f + fIF^b$		0 dBc (nominal), High Band Image Suppression is lost with Option MPB.
LO Harmonic and Subharmonic Responses		
3.5 to 8.4 GHz $N(f + fIF) \pm fIFb$		-10 dBc (nominal), N = 2, 3
8.3 to 26.5 GHz $[N(f + fIF)/2] \pm fIFb$		-10 dBc (nominal), N = 1, 3, 4
26.4 to 34.5 GHz $[N(f + fIF)/4] \pm fIFb$		-10 dBc (nominal), N = 1, 2, 3, 5, 6, 7
34.4 to 50 GHz $[N(f + fIF)/8] \pm fIFb$		-10 dBc (nominal), N = 1, 2, 3, 5, 6, 7, 9, 10
Second Harmonic Response		
3.5 to 13.6 GHz $f/2$		-72 dBc (nominal) for -40 dBm mixer level
13.5 to 34.5 GHz $f/2$		-68 dBc (nominal) for -40 dBm mixer level
34.4 to 50 GHz $f/2$		-68 dBc (nominal) for -40 dBm mixer level
IF Feedthrough Response		
3.5 to 13.6 GHz $fIFb$		-100 dBc (nominal)
13.5 to 50 GHz $fIFb$		-90 dBc (nominal)

- a. Dominate spurious responses are described here. Generally, other *Option MPB*-specific spurious responses will be substantially lower than those listed here, but may exceed core specifications.
- b.  $fIF = 322.5$  MHz except  $fIF = 250$  MHz with *Option B40* and  $fIF = 300$  MHz with *Option B85*, or *B1X*.

## 17 Options P03, P08, P13, P26, P43, P44 and P50 – Preamplifiers

This chapter contains specifications for the PXA Signal Analyzer *Options P03, P08, P13, P26, P43, P44 and P50* preamplifiers.

## Specifications Affected by Preamp

Specification Name	Information
Nominal Dynamic Range vs. Offset Frequency vs. RBW	The graphic from the core specifications does not apply with Preamp On.
Measurement Range	The measurement range depends on displayed average noise level (DANL). See <b>“Amplitude Accuracy and Range” on page 33</b> .
Gain Compression	See specifications in this chapter.
DANL with NFE Off	See specifications in this chapter.
DANL with NFE (Noise Floor Extension)	See <b>“Displayed Average Noise Level (DANL) (with Noise Floor Extension) Improvement” on page 52</b> of the core specifications.
Frequency Response	See specifications in this chapter.
Absolute Amplitude Accuracy	See <b>“Absolute Amplitude Accuracy” on page 39</b> of the core specifications.
RF Input VSWR	See plot in this chapter.
Display Scale Fidelity	See <b>Display Scale Fidelity on page 45</b> of the core specifications. Then, adjust the mixer levels given downward by the preamp gain given in this chapter.
Second Harmonic Distortion	See specifications in this chapter.
Third Order Intermodulation Distortion	See specifications in this chapter.
Other Input Related Spurious	See <b>“Spurious Responses” on page 55</b> of the core specifications. Preamp performance is not warranted but is nominally the same as non-preamp performance.
Dynamic Range	See plot in this chapter.
Gain	See “Preamp” specifications in this chapter.
Noise Figure	See “Preamp” specifications in this chapter.

## Other Preamp Specifications

Description	Specifications	Supplemental Information
<b>Preamp</b> (Options P03, P08, P13, P26, P43, P44 and P50) <sup>a</sup>  <b>Gain</b> 100 kHz to 3.6 GHz 3.6 to 26.5 GHz 26.5 to 50 GHz  <b>Noise figure</b> 100 kHz to 3.6 GHz  3.6 to 8.4 GHz 8.4 to 13.6 GHz 13.6 to 50 GHz		Maximum <sup>b</sup> +20 dB (nominal) +35 dB (nominal) +40 dB (nominal)  8 to 12 dB (proportional to frequency) (nominal) Note on DC coupling <sup>c</sup> 9 dB (nominal) 10 dB (nominal) Noise Figure is DANL + 176.24 dB (nominal) <sup>d</sup>

- The preamp follows the input attenuator, AC/DC coupling switch, and precedes the input mixer. In low-band, it follows the 3.6 GHz low-pass filter. In high-band, it precedes the preselector.
- Preamp Gain directly affects distortion and noise performance, but it also affects the range of levels that are free of final IF overload. The user interface has a designed relationship between input attenuation and reference level to prevent on-screen signal levels from causing final IF overloads. That design is based on the maximum preamp gains shown. Actual preamp gains are modestly lower, by up to nominally 5 dB for frequencies from 100 kHz to 3.6 GHz, and by up to nominally 10 dB for frequencies from 3.6 to 50 GHz.
- The effect of AC coupling is negligible for frequencies above 40 MHz. Below 40 MHz, DC coupling is recommended for the best measurements. The instrument NF nominally degrades by 0.2 dB at 30 MHz and 1 dB at 10 MHz with AC coupling.

- Nominally, the noise figure of the spectrum analyzer is given by

$$NF = D - (K - L + N + B)$$

where, D is the DANL (displayed average noise level) specification (Refer to [page 211](#) for DANL with Preamp),

K is kTB (−173.98 dBm in a 1 Hz bandwidth at 290 K),

L is 2.51 dB (the effect of log averaging used in DANL verifications)

N is 0.24 dB (the ratio of the noise bandwidth of the RBW filter with which DANL is specified to an ideal noise bandwidth)

B is ten times the base-10 logarithm of the RBW (in hertz) in which the DANL is specified. B is 0 dB for the 1 Hz RBW.

The actual NF will vary from the nominal due to frequency response errors.

Options P03, P08, P13, P26, P43, P44 and P50 – Preamplifiers  
Other Preamp Specifications

Description	Specifications	Supplemental Information
<b>1 dB Gain Compression Point</b> <b>(Two-tone)<sup>a</sup></b> <i>(Preamp On (Options P03, P08, P13, P26, P43, P44 or P50))</i> Maximum power at the preamp <sup>b</sup> for 1 dB gain compression 10 MHz to 3.6 GHz 3.6 to 26.5 GHz Tone spacing 100 kHz to 20 MHz Tone spacing > 70 MHz Freq Option ≤ 526 Freq Option > 526 26.5 to 50 GHz		–14 dBm (nominal)   –28 dBm (nominal)   –10 dBm (nominal) –20 dBm (nominal) –30 dBm (nominal)

a. Large signals, even at frequencies not shown on the screen, can cause the analyzer to mismeasure on-screen signals because of two-tone gain compression. This specification tells how large an interfering signal must be in order to cause a 1 dB change in an on-screen signal.

b. Total power at the preamp (dBm) = total power at the input (dBm) – input attenuation (dB).

Options P03, P08, P13, P26, P43, P44 and P50 - Preamplifiers

46 to 50 GHz			x	−150 dBm	−144 dBm	−153 dBm

a. DANL for zero span and swept is measured in a 1 kHz RBW and normalized to the narrowest available RBW, because the noise figure does not depend on RBW and 1 kHz measurements are faster.

Options P03, P08, P13, P26, P43, P44 and P50 – Preamplifiers  
Other Preamp Specifications

- b. Specifications marked with an x in this column apply to analyzers with mmW frequency options (Option 543, 544 or 550) and none of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- c. Specifications marked with an x in this column apply to analyzers with mmW frequency options (Option 543, 544 or 550) and one or more of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- d. For S/N prefix < US/MY/SG5235, the following specifications apply:

Description				Specifications		Supplemental Information
mmW with no signal path options <sup>b</sup>						
mmW with one or more signal path options <sup>c</sup>						
RF/ $\mu$ W (Option 503, 508, 513, or 526)						
Option P03, P08, P13, P26, P43, P44 or P50				20 to 30°C	Full range	Typical
100 to 200 kHz	x	x	x	-157 dBm	-156 dBm	-160 dBm
200 to 500 kHz	x	x	x	-160 dBm	-159 dBm	-163 dBm
500 kHz to 1 MHz <sup>e</sup>	x			-164 dBm	-162 dBm	-166 dBm
500 kHz to 1 MHz <sup>e</sup>		x	x	-162 dBm	-161 dBm	-165 dBm
1 to 10 MHz	x	x	x	-164 dBm	-163 dBm	-167 dBm

- e. Specifications apply only when the Phase Noise Optimization control is set to “Best Wide-offset Phase Noise.”

Options P03, P08, P13, P26, P43, P44 and P50 – Preamplifiers  
Other Preamp Specifications

34.4 to 50 GHzef		x	±4.1 dB	±6.0 dB	±1.69 dB

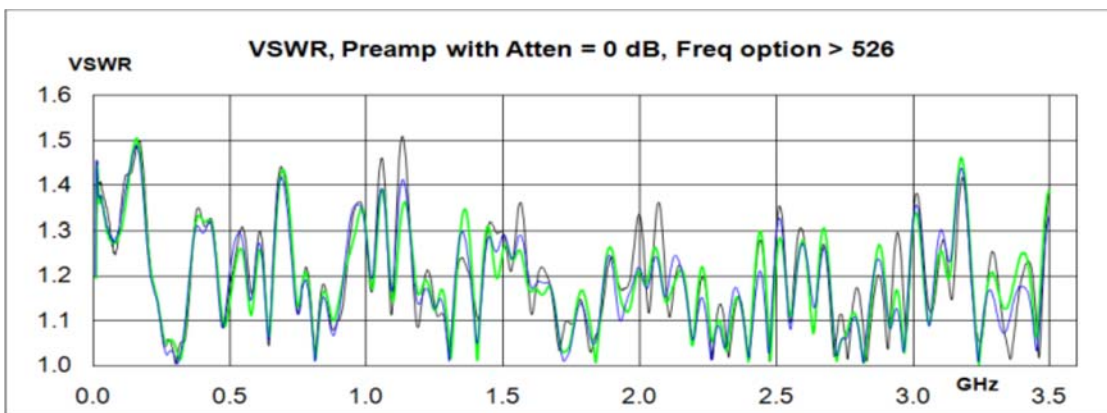

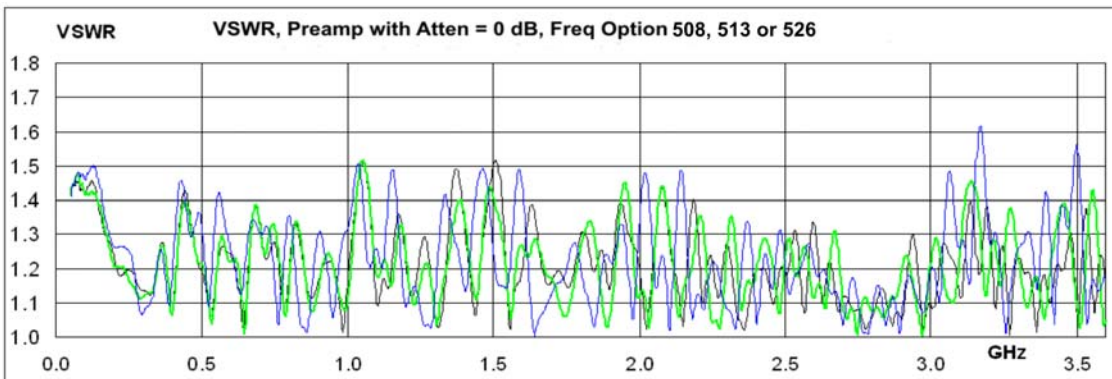

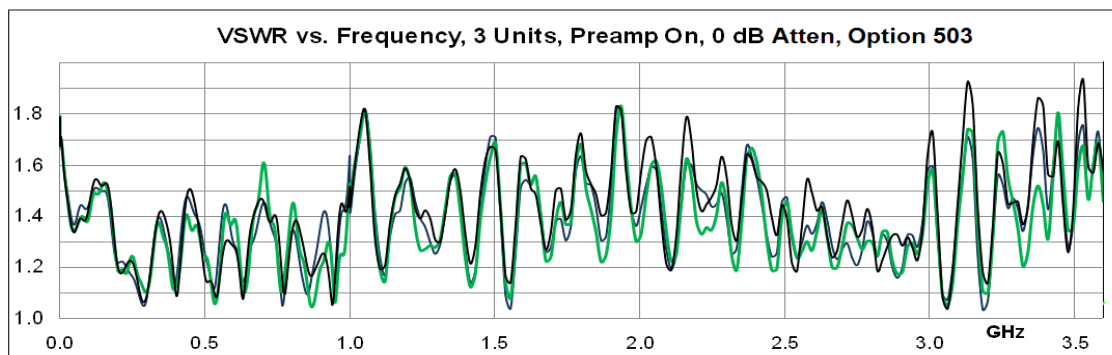

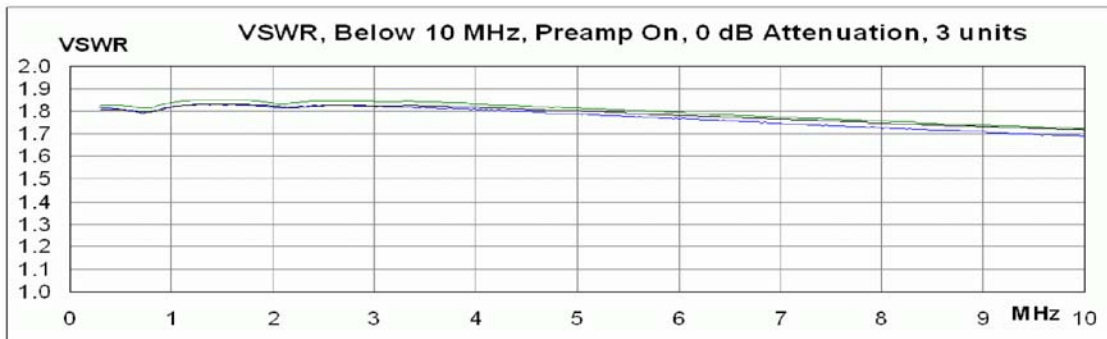

- Signal frequencies above 18 GHz are prone to response errors due to modes in the Type-N connector. Only analyzers with frequency *Option 526* that do not also have input connector *Option C35* will have these modes. With the use of Type-N to APC 3.5 mm adapter part number 1250-1744, there are nominally six such modes. The effect of these modes with this connector are included within these specifications.
- For Sweep Type = FFT, add the RF flatness errors of this table to the IF Frequency Response errors. An additional error source, the error in switching between swept and FFT sweep types, is nominally ±0.01 dB and is included within the “Absolute Amplitude Error” specifications.
- Electronic attenuator (Option EA3) may not be used with preamp on.
- All instruments are tested against a suitable test line limit in factory production but not in field calibration.
- Specifications for frequencies > 3.5 GHz apply for sweep rates < 100 MHz/ms.
- Preselector centering applied.

Options P03, P08, P13, P26, P43, P44 and P50 – Preamplifiers  
Other Preamp Specifications

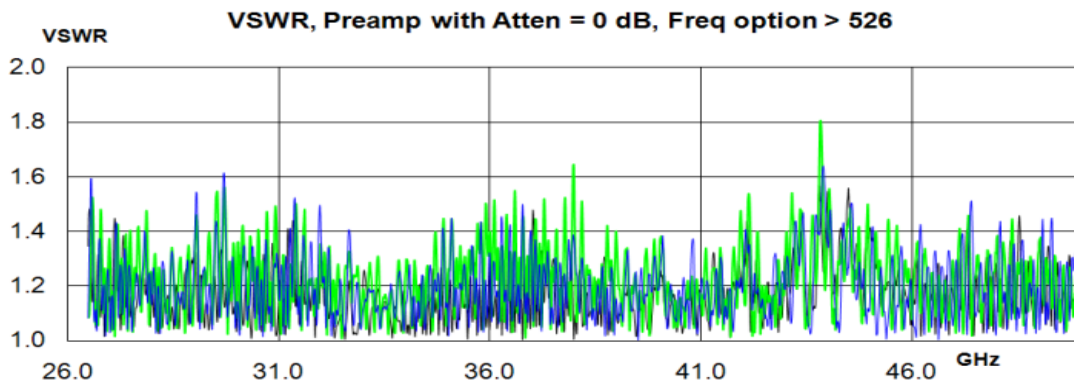

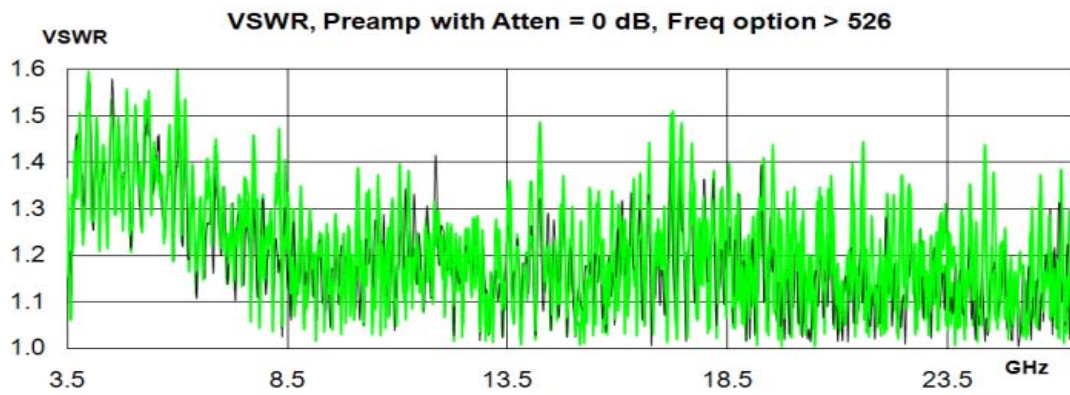

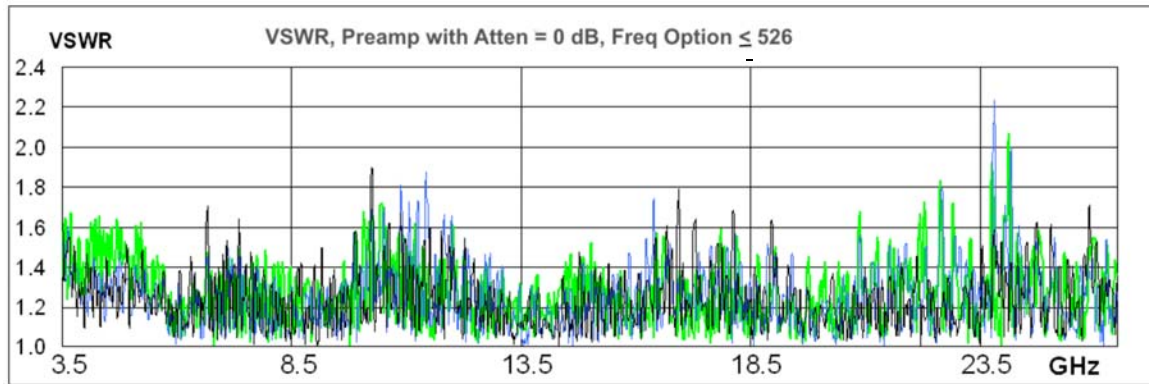

Description	Specifications			Supplemental Information

Band 3 (13.5 to 17.1 GHz)		x	1.48	
Band 3 (13.5 to 17.1 GHz)		x	1.330	
Band 4 (17.0 to 26.5 GHz)		x	1.54	
Band 4 (17.0 to 26.5 GHz)		x	1.339	
Band 5 (26.4 to 34.5 GHz)		x	1.41	
Band 6 (34.4 to 50 GHz)		x	1.42	
Nominal VSWR vs. Freq, 0 dB				See plots following

- a. X-Series analyzers have a reflection coefficient that is excellently modeled with a Rayleigh probability distribution. Keysight recommends using the methods outlined in Application Note 1449-3 and companion Average Power Sensor Measurement Uncertainty Calculator to compute mismatch uncertainty. Use this 95th percentile VSWR information and the Rayleigh model (Case C or E in the application note) with that process.

**Nominal VSWR – Preamp On Low Band (Plot)**

Nominal VSWR – Preamp, Above 3.5 GHz [Plot]

Options P03, P08, P13, P26, P43, P44 and P50 – Preamplifiers  
Other Preamp Specifications

Description	Specifications	Supplemental Information		
<b>Second Harmonic Distortion</b>		<b>Preamp Level<sup>a</sup></b>	<b>Distortion (nominal)</b>	<b>SHI<sup>b</sup> (nominal)</b>
Source Frequency				
10 MHz to 1.8 GHz		–45 dBm	–78 dBc	+33 dBm
1.8 to 13.25 GHz		–50 dBm	–60 dBc	+10 dBm
13.26 to 25 GHz		–50 dBm	–50 dBc	0 dBm

a. Preamp Level = Input Level – Input Attenuation.

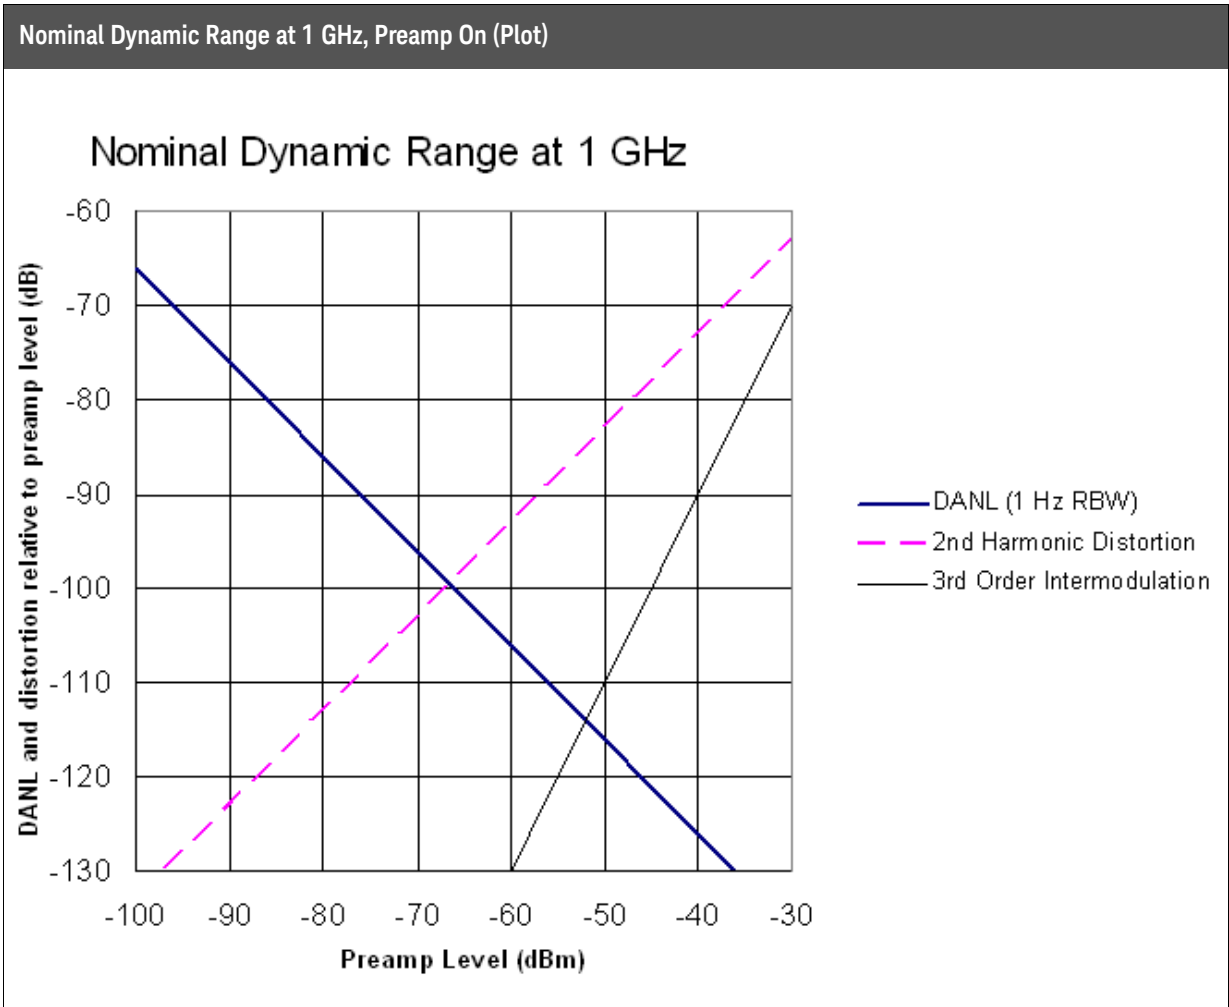

b. SHI = second harmonic intercept. The SHI is given by the mixer power in dBm minus the second harmonic distortion level relative to the mixer tone in dBc.

Description	Specifications	Supplemental Information		
<b>Third Order Intermodulation Distortion</b>				
(Tone separation 5 times IF Prefilter Bandwidth <sup>a</sup> Sweep type not set to FFT)				
		<b>Preamp Level<sup>b</sup></b>	<b>Distortion (nominal)</b>	<b>TOI<sup>c</sup> (nominal)</b>
10 MHz to 500 MHz		–45 dBm	–98 dBc	+4 dBm
500 MHz to 3.6 GHz		–45 dBm	–99 dBc	+4.5 dBm
3.6 to 26.5 GHz		–50 dBm	–70 dBc	–15 dBm

a. See the IF Prefilter Bandwidth table in the specifications for **“Gain Compression” on page 47**. When the tone separation condition is met, the effect on TOI of the setting of IF Gain is negligible.

b. Preamp Level = Input Level – Input Attenuation.

c. TOI = third order intercept. The TOI is given by the preamplifier input tone level (in dBm) minus (distortion/2) where distortion is the relative level of the distortion tones in dBc.

## 18 Options RT1, RT2 – Real-time Spectrum Analyzer (RTSA)

This chapter contains specifications for the PXA Signal Analyzer *Options RT1*, real-time analysis up to 160 MHz, basic detection, and *RT2*, real-time analysis up to 160 MHz, optimum detection.

## Real-time Spectrum Analyzer Performance

Description	Specs & Nominals		Supplemental Information
<b>General Frequency Domain Characteristics</b>			
Maximum real-time analysis bandwidth ( <i>Option RT1</i> or <i>RT2</i> )			Determined by analysis BW option
With <i>Option B1X</i>	160 MHz		
With <i>Option B85</i>	85 MHz		
Minimum signal duration with 100% probability of intercept (POI) at full amplitude accuracy	<b>Opt RT2</b>	<b>Opt RT1</b>	Maximum span: Default window is Kaiser; Viewable on screen
With <i>Option B1X</i>			
Span = 85 MHz	3.7 $\mu$ s	3.7 $\mu$ s	
Span > 85 MHz	3.57 $\mu$ s	17.3 $\mu$ s	
With <i>Option B85</i>	3.7 $\mu$ s	3.7 $\mu$ s	
Supported Detectors			Peak, Negative Peak, Sample, Average
Number of Traces	6		Clear Write, Max Hold, Min Hold
Resolution Bandwidths (Window type = Kaiser)			6 RBWs available for each window type, Nominal Span:RBW ratio for windows: Flattop = 6.7 to 212, Gaussian, Blackman-Harris = 13 to 417, Kaiser = 13 to 418, Hanning = 17 to 551
Span	<b>Min RBW</b>	<b>Max RBW</b>	
160 MHz	383 kHz	12.2 MHz <sup>a</sup>	
100 MHz	239 kHz	7.6 MHz	
50 MHz	120 kHz	3.8 MHz	
10 MHz	23.9 kHz	763 kHz	
1 MHz	2.39 kHz	76.3 kHz	
100 kHz	239 Hz	7.63 kHz	
Window types	Hanning, Blackman-Harris, Rectangular, Flattop, Kaiser, Gaussian		

Options RT1, RT2 - Real-time Spectrum Analyzer (RTSA)  
Real-time Spectrum Analyzer Performance

Description	Specs & Nominals	Supplemental Information
Maximum Sample Rate		Complex
With <i>Option B1X</i>	200 MSa	
With <i>Option B85</i>	106 MSa	
FFT Rate	292,969/s	Nominal value for maximum sample rate. For all spans greater than 300 kHz.
Supported Triggers		Level, Level with Time Qualified (TQT), Line, External, RF Burst, Frame, Frequency Mask (FMT), FMT with TQT
Number of Markers	12	
Supported Markers		Normal, Delta, Noise, Band Power
Amplitude resolution	0.01 dB	
Frequency points	821	
Minimum acquisition time	104 $\mu$ s <sup>b</sup>	Value for maximum sample rate

- a. This maximum RBW value is for *Option RT2* only and applies to all window types. *Option RT1* has a maximum RBW of 10 MHz.
- b. For spectrogram only. For Density view: 30 ms. For Density & spectrogram: 90 ms.

Description	Specs & Nominals	Supplemental Information
<b>Density View</b>		
Probability range	0-100%	
Minimum Span	100 Hz	0.001% steps
Maximum Span		160 MHz in real-time. Stitched density supports full frequency of instrument
Persistence duration	10 s	
Color palettes	Cool, Warm, Grayscale, Radar, Fire, Frost	
<b>Spectrogram View</b>		
Maximum number of acquisitions stored	10,000	5,000 with power vs. time combination view
Dynamic range covered by colors	200 dB	

Options RT1, RT2 - Real-time Spectrum Analyzer (RTSA)  
Real-time Spectrum Analyzer Performance

Description	Specs & Nominals	Supplemental Information
<b>Power vs. Time</b>		
Supported Detectors		Peak, Negative Peak, Sample, Average
Supported Triggers		Level, Level with Time Qualified (TQT), Line, External, RF Burst, Frame, Frequency Mask (FMT), FMT with TQT
Number of Markers	12	
Maximum Time Viewable	40 s	
Minimum Time Viewable	215 $\mu$ s	
Minimum detectable signal For <i>Option RT2</i> only; Available with "Multi-view".		Signal must have >60 dB Signal-to-Mask (StM) to maintain 100% POI. Does not include analog front-end effects.
With <i>Option B1X</i>	5 ns	
With <i>Option B85</i>	11.42 ns	

Options RT1, RT2 - Real-time Spectrum Analyzer (RTSA)  
Real-time Spectrum Analyzer Performance

Description	Specs & Nominals					Supplemental Information
<b>Frequency Mask Trigger (FMT)</b>						
Trigger Views	Density, Spectrogram, Normal					
Trigger resolution	0.5 dB					
Trigger conditions	Enter, Leave, Inside, Outside, Enter->Leave, Leave->Enter, TQT					
Minimum TQT Duration @ 160 MHz span (or BW)	5.12 μs					The minimum TQT duration is inversely proportional to the span (or BW)
Minimum detectable signal duration with >60 dB Signal-to Mask (StM)						Does not include analog front-end effects. For <i>Option RT2</i> only
With <i>Option B1X</i>	5 ns					
With <i>Option B85</i>	11.42 ns					
Minimum signal duration (in μs) for 100% probability of FMT triggering with various RBW						RBW 1 through 6 can be selected under Bandwidth [BW] Manual.
<i>Option RT1</i>						
Span (MHz)	160	120	80	40	20	
RBW 6	17.23	17.27	17.41	17.72	18.44	
RBW 5	17.39	17.49	17.73	18.36	19.72	
RBW 4	17.71	17.91	18.37	19.64	22.28	
RBW 3	18.35	18.77	19.65	22.20	27.40	
RBW 2	19.63	20.47	22.21	27.32	37.64	
RBW 1	22.19	23.89	27.33	37.56	58.12	
<i>Option RT2</i>						
Span (MHz)	160	120	80	40	20	
RBW 6	3.57	3.62	3.73	4.04	4.68	
RBW 5	3.73	3.83	4.05	4.68	5.96	
RBW 4	4.05	4.26	4.69	5.96	8.52	
RBW 3	4.69	5.11	5.97	8.52	13.6	
RBW 2	5.97	6.82	8.53	13.6	23.9	
RBW 1	8.53	10.23	13.65	23.88	44.4	

Options RT1, RT2 - Real-time Spectrum Analyzer (RTSA)  
Real-time Spectrum Analyzer Performance

Description	Specs & Nominals					Supplemental Information
Minimum signal duration (in $\mu$ s) for 100% probability of FMT triggering with various StM						For 1024-point Blackmann-Harris window.
<i>Option RT1</i>						
Span (MHz)	<b>160</b>	<b>120</b>	<b>80</b>	<b>40</b>	<b>20</b>	
0 dB offset	22.19	23.89	13.65	22.88	44.36	
6 dB offset	17.08	17.07	3.48	4.66	8.36	
12 dB offset	16.10	15.77	1.76	2.22	4.00	
20 dB offset	15.23	14.61	0.71	0.88	1.64

## 19 Option YAV – Y-Axis Video Output

This chapter contains specifications for *Option YAV* (Y-Axis Video Output).

## Specifications Affected by Y-Axis Video Output

No other analyzer specifications are affected by the presence or use of this option. New specifications are given in the following pages.

## Other Y-Axis Video Output Specifications

### General Port Specifications

Description	Specifications	Supplemental Information
Connector	BNC female	Shared with other options
Impedance		50 $\Omega$ (nominal)

### Screen Video

Description	Specifications	Supplemental Information
<b>Operating Conditions</b>		
Display Scale Types	All (Log and Lin)	“Lin” is linear in voltage
Log Scales	All (0.1 to 20 dB/div)	
Modes	Spectrum Analyzer only	
FFT & Sweep	Select sweep type = Swept.	
Gating	Gating must be off.	
<b>Output Signal</b>		Replication of the RF Input Signal envelope, as scaled by the display settings
Differences between display effects and video output		
Detector = Peak, Negative, Sample, or Normal	The output signal represents the input envelope excluding display detection	
Average Detector	The effect of average detection in smoothing the displayed trace is approximated by the application of a low-pass filter	Nominal bandwidth: $LPFBW = \frac{Npoints - 1}{SweepTime \cdot \pi}$
EMI Detectors	The output will not be useful.	
Trace Averaging	Trace averaging affects the displayed signal but does not affect the video output	
<b>Amplitude Range</b>		Range of represented signals
Minimum	Bottom of screen	
Maximum	Top of Screen + Overrange	
Overrange		Smaller of 2 dB or 1 division, (nominal)

Option YAV – Y-Axis Video Output  
Other Y-Axis Video Output Specifications

Description	Specifications	Supplemental Information
<b>Output Scaling<sup>a</sup></b>	0 to 1.0 V open circuit, representing bottom to top of screen	
Offset		±1% of full scale (nominal)
Gain accuracy		±1% of output voltage (nominal)
<b>Delay</b> (RF Input to Analog Out)		71.7 $\mu$ s + 2.56/RBW + 0.159/VBW (nominal) ( <i>Option B40</i> only)

- a. The errors in the output can be described as offset and gain errors. An offset error is a constant error, expressed as a fraction of the full-scale output voltage. The gain error is proportional to the output voltage. Here's an example. The reference level is –10 dBm, the scale is log, and the scale is 5 dB/division. Therefore, the top of the display is –10 dBm, and the bottom is –60 dBm. Ideally, a –60 dBm signal gives 0 V at the output, and –10 dBm at the input gives 1 V at the output. The maximum error with a –60 dBm input signal is the offset error, ±1% of full scale, or ±10 mV; the gain accuracy does not apply because the output is nominally at 0 V. If the input signal is –20 dBm, the nominal output is 0.8 V. In this case, there is an offset error (±10 mV) plus a gain error (±1% of 0.8 V, or ±8 mV), for a total error of ±18 mV.

## Continuity and Compatibility

Description	Specifications	Supplemental Information
<b>Continuity and Compatibility</b>		
Output Tracks Video Level		
During sweep		Except band breaks in swept spans
Zero span	Yes	
FFT spans	No	
Swept spans		
≤2.5 MHz	Yes	
>2.5, ≤10 MHz		Sweep segmentation interruptions <sup>a</sup>
>10, ≤100 MHz	Yes	
>100 MHz		Band crossing interruptions possible
Between sweeps	See supplemental information	Before sweep interruption <sup>b</sup> Alignments <sup>c</sup> Auto Align = Partial <sup>de</sup>
External trigger, no trigger <sup>e</sup>	Yes	
HP 8566/7/8 Compatibility <sup>f</sup>		Recorder output labeled "Video"

Option YAV – Y-Axis Video Output  
Other Y-Axis Video Output Specifications

Description	Specifications	Supplemental Information
Continuous output		Alignment differences <sup>g</sup> Band crossing <sup>h</sup> FFTs <sup>i</sup>
Output impedance		Two variants <sup>j</sup>
Gain calibration		LL and UR not supported <sup>k</sup>
RF Signal to Video Output Delay		See footnote <sup>l</sup>

- a. In these spans, the sweep is segmented into sub-spans, with interruptions between these subspans. These can be prevented by setting the Phase Noise Optimize key to Fast Tuning.
- b. There is an interruption in the tracking of the video output before each sweep. During this interruption, the video output holds instead of tracks for a time period given by approximately 1.8/RBW.
- c. There is an interruption in the tracking of the video output during alignments. During this interruption, the video output holds instead of tracking the envelope of the RF input signal. Alignments may be set to prevent their interrupting video output tracking by setting Auto Align to Off.
- d. Setting Auto Align to Off usually results in a warning message soon thereafter. Setting Auto Align to Partial results in many fewer and shorter alignment interruptions, and maintains alignments for a longer interval.
- e. If video output interruptions for Partial alignments are unacceptable, setting the analyzer to External Trigger without a trigger present can prevent these from occurring, but will prevent there being any on-screen updating. Video output is always active even if the analyzer is not sweeping.
- f. This section of specifications shows compatibility of the Screen Video function with HP 8566-Series analyzers. Compatibility with ESA and PSA analyzers is similar in most respects.
- g. The HP 8566-series analyzer(s) did not have alignments and interruptions that interrupted video outputs, as discussed above.
- h. The location of the boundaries between harmonic mixing bands is different between the HP 8566-series analyzer(s) and this analyzer. Also, this analyzer uses segmented sweeps for spans between 2.5 and 10 MHz.
- i. The HP 8566-series analyzer(s) did not have FFT sweeps. This analyzer compatibility is improved if the sweep type is set to Manual and Swept.
- j. Early HP 8566-series analyzer(s) had a 140 $\Omega$  output impedance; later ones had 190 $\Omega$ . The specification was <475 $\Omega$ . The Analog Out port has a 50 $\Omega$  impedance.
- k. The HP 8566-series analyzer(s) had LL (lower left) and UR (upper right) controls that could be used to calibrate the levels from the video output circuit. These controls are not available in this option.
- l. The delay between the RF input and video output shown in **Delay on page 230** is much higher than the delay in the HP 8566-series analyzer(s). The latter has a delay of approximately 0.554/RBW + 0.159/VBW.

## Log Video Output

Description	Specifications	Supplemental Information
<b>Amplitude Range</b> (terminated with 50 $\Omega$ )  Maximum  Scale factor		1.0 V (nominal) for signal envelope of – 10 dBm at the mixer  Output changes 1 V for every 192.66 dB change in signal envelope
<b>Band width</b>	Set by RBW	
<b>Operating Conditions</b>	Select Sweep Type = Swept.	

## Linear Video (AM Demod) Output

Description	Specifications	Supplemental Information
<b>Amplitude Range</b> (terminated with 50 $\Omega$ )  Maximum  Minimum  Scale factor		1.0 V (nominal) for signal envelope at the reference level  0 V  If carrier level is set to half the reference level in volts, the scale factor is 200%/V
<b>Band width</b>	Set by RBW	
<b>Operating Conditions</b>	Select Sweep Type = Swept.	

## 20 Analog Demodulation Measurement Application

This chapter contains specifications for the N9063A Analog Demodulation Measurement Application.

### Additional Definitions and Requirements

The warranted specifications shown apply to Band 0 operation (up to 3.6 GHz), unless otherwise noted, for all analyzers. The application functions, with nominal (non-warranted) performance, at any frequency within the frequency range set by the analyzer frequency options (see table). In practice, the lowest and highest frequency of operation may be further limited by AC coupling; by "folding" near 0 Hz; by DC feedthrough; and by Channel BW needed. Phase noise and residual FM generally increase in higher bands.

Warranted specifications shown apply when Channel BW  $\leq 1$  MHz, unless otherwise noted. (Channel BW is an important user-settable control.) The application functions, with nominal (non-warranted) performance, at any Channel BW up to the analyzer's bandwidth options (see table). The Channel BW required for a measurement depends on: the type of modulation (AM, FM, PM); the rate of modulation; the modulation depth or deviation; and the spectral contents (e.g. harmonics) of the modulating tone. Many specifications require that the Channel BW control is optimized: neither too narrow nor too wide.

Many warranted specifications (rate, distortion) apply only in the case of a single, sinusoidal modulating tone without excessive harmonics, non-harmonics, spurs, or noise. Harmonics, which are included in most distortion results, are counted up to the 10th harmonic of the dominant tone, or as limited by SINAD BW or post-demod filters. Note that SINAD will include Carrier Frequency Error (the "DC term") in FM by default; it can be eliminated with a HPF or Auto Carrier Frequency feature.

Warranted specifications apply to results of the software application; the hardware demodulator driving the Analog Out line is described separately.

Warranted specifications apply over an operating temperature range of 20° to 30°C; and mixer level

–24 to –18 dBm (mixer level = Input power level – Attenuation). Additional conditions are listed at the beginning of the FM, AM, and PM sections, in specification tables, or in footnotes.

Certain features require analyzer software revision A.14.xx or higher; and may require *Option N9063A-AFP* (orderable as *Option N9063A-MEU* starting May 1, 2014).

See **"Definitions of terms used in this chapter" on page 234.**

**Definitions of terms used in this chapter**

Let  $P_{\text{signal}}$  (S) = Power of the signal;  $P_{\text{noise}}$  (N) = Power of the noise;  $P_{\text{distortion}}$  (D) = Power of the harmonic distortion ( $P_{H2} + P_{H3} + \dots + P_{Hn}$  where  $H_i$  is the  $i^{\text{th}}$  harmonic up to  $i=10$ );  
 $P_{\text{total}}$  = Total power of the signal, noise and distortion components.

Term	Short Hand	Definition
Distortion	$\frac{N + D}{S + N + D}$	$(P_{\text{total}} - P_{\text{signal}})^{1/2} / (P_{\text{total}})^{1/2} \times 100\%$
THD	$\frac{D}{S}$	$(P_{\text{distortion}})^{1/2} / (P_{\text{signal}})^{1/2} \times 100\%$ where THD is the total harmonic distortion
SINAD	$\frac{S + N + D}{N + D}$	$20 \times \log_{10} [1/(P_{\text{distortion}})]^{1/2} = 20 \times \log_{10} [(P_{\text{total}})^{1/2} / (P_{\text{total}} - P_{\text{signal}})^{1/2}]$ where SINAD is Signal-to-Noise-And-Distortion ratio
SNR	$\frac{S + N + D}{N}$	$P_{\text{signal}} / P_{\text{noise}} \sim (P_{\text{signal}} + P_{\text{noise}} + P_{\text{distortion}}) / P_{\text{noise}}$ where SNR is the Signal-to-Noise Ratio. The approximation is per the implementations defined with the Keysight 8903A.

**NOTE**

$P_{\text{noise}}$  must be limited to the bandwidth of the applied filters.  
The harmonic sequence is limited to the 10th harmonic unless otherwise indicated.  
In practice, the term  $P_{\text{noise}}$  includes Spurs, IMD, Hum, etc. (All but harmonics.)

## RF Carrier Frequency and Bandwidth

Description	Specifications	Supplemental Information
<b>Carrier Frequency</b>		
Maximum Frequency		
<i>Option 503</i>	3.6 GHz	RF/ $\mu$ W frequency option
<i>Option 508</i>	8.4 GHz	RF/ $\mu$ W frequency option
<i>Option 513</i>	13.6 GHz	RF/ $\mu$ W frequency option
<i>Option 526</i>	26.5 GHz	RF/ $\mu$ W frequency option
<i>Option 543</i>	43 GHz	mmW frequency option
<i>Option 544</i>	44 GHz	mmW frequency option
<i>Option 550</i>	50 GHz	mmW frequency option
Minimum Frequency		
AC Coupled <sup>a</sup>	10 MHz	In practice, limited by the need to keep modulation sidebands from folding, and by the interference from LO feedthrough.
DC Coupled	3 Hz	
<b>Maximum Information Bandwidth (Info BW)<sup>b</sup></b>		
Standard	8 MHz	
<i>Option B25</i>	25 MHz	
<i>Option B40</i>	40 MHz	
<i>Option B85</i>	85 MHz	
<i>Option B1X</i>	160 MHz	
<b>Capture Memory</b>	3.6 MSa	Each sample is an I/Q pair.
(Sample Rate $\times$ Acq Time)		See note <sup>c</sup>

- a. AC Coupled is only applicable to frequency *Options 503, 508, 513, and 526*.
- b. The maximum Info BW indicates the maximum operational BW, which depends on the analysis BW option equipped with the analyzer. However, the demodulation specifications only apply to the Channel BW indicated in the following sections.
- c. Sample rate is set indirectly by the user, with the Span and Channel BW controls (viewed in RF Spectrum). The Info BW (also called Demodulation BW) is based on the larger of the two; specifically, Info BW = max [Span, Channel BW]. The sample interval is  $1/(1.25 \times \text{Info BW})$ ; e.g. if Info BW = 200 kHz, then sample interval is 4  $\mu$ s. The sample rate is  $1.25 \times \text{Info BW}$ , or  $1.25 \times \text{max} [\text{Span}, \text{Channel BW}]$ . These values are approximate, to estimate memory usage. Exact values can be queried via SCPI while the application is running. Acq Time (acquisition time) is set by the largest of 4 controls:  
Acq Time = max[2.0 / (RF RBW), 2.0 / (AF RBW), 2.2  $\times$  Demod Wfm Sweep Time, Demod Time]

## Post-Demodulation

Description	Specifications	Supplemental Information
<b>Maximum Audio Frequency Span</b>		1/2 × Channel BW
<b>Filters</b>		
High Pass	20 Hz	2-Pole Butterworth
	50 Hz	2-Pole Butterworth
	300 Hz	2-Pole Butterworth
	400 Hz <sup>a</sup>	10-Pole Butterworth; used to attenuate sub-audible signaling tones
Low Pass	300 Hz	5-Pole Butterworth
	3 kHz	5-Pole Butterworth
	15 kHz	5-Pole Butterworth
	30 kHz	3-Pole Butterworth
	80 kHz	3-Pole Butterworth
	300 kHz	3-Pole Butterworth
	100 kHz (>20 kHz Bessel) <sup>a</sup>	9-Pole Bessel; provides linear phase response to reduce distortion of square-wave modulation, such as FSK or BPSK
Band Pass	Manual <sup>a</sup>	Manually tuned by user, range 300 Hz to 20 MHz; 5-Pole Butterworth; for use with high modulation rates
	CCITT	ITU-T O.41, or ITU-T P.53; known as "psophometric"
	A-Weighted <sup>a</sup>	ANSI IEC rev 179
	C-Weighted <sup>a</sup>	Roughly equivalent to 50 Hz HPF with 10 kHz LPF
	C-Message <sup>a</sup>	IEEE 743, or BSTM 41004; similar in shape to CCITT, sometimes called "psophometric"
	CCIR-1k Weighted <sup>ab</sup>	ITU-R 468, CCIR 468-2 Weighted, or DIN 45 405
	CCIR-2k Weighted <sup>ab</sup>	ITU 468 ARM or CCIR/ARM (Average Responding Meter), commonly referred to as "Dolby" filter
De-emphasis (FM only)	CCIR Unweighted <sup>a</sup>	ITU-R 468 Unweighted <sup>b</sup>
	25 μs	Equivalent to 1-pole LPF at 6366 Hz

Analog Demodulation Measurement Application  
Post-Demodulation

Description	Specifications	Supplemental Information
SINAD Notch <sup>c</sup>	50 $\mu$ s	Equivalent to 1-pole LPF at 3183 Hz; broadcast FM for most of world
	75 $\mu$ s	Equivalent to 1-pole LPF at 2122 Hz; broadcast FM for U.S.
	750 $\mu$ s	Equivalent to 1-pole LPF at 212 Hz; 2-way mobile FM radio.
Signaling Notch <sup>ac</sup>		<p>Tuned automatically by application to highest AF response, for use in SINAD, SNR, and Distortion calculations; complies with TI-603 and ITU-O.132; stop bandwidth is <math>\pm 13\%</math> of tone frequency.</p> <p>FM only; manually tuned by user, range 50 to 300 Hz; used to eliminate CTCSS or CDCSS signaling tone; complies with TIA-603 and ITU-O.132; stop bandwidth is <math>\pm 13\%</math> of tone frequency.</p>

- a. Requires *Option N9063A-AFP*.
- b. ITU standards specify that CCIR-1k Weighted and CCIR Unweighted filters use Quasi-Peak-Detection (QPD). However, the implementation in N9063A is based on true-RMS detection, scaled to respond as QPD. The approximation is valid when measuring amplitude of Gaussian noise, or SINAD of a single continuous sine tone (e.g. 1 kHz), with harmonics, combined with Gaussian noise. The results may not be consistent with QPD if the input signal is bursty, clicky, or impulsive; or contains non-harmonically related tones (multi-tone, intermods, spurs) above the noise level. Use the AF Spectrum trace to validate these assumptions. Consider using Keysight U8903A Audio Analyzer if true QPD is required.
- c. The Signaling Notch filter does not visibly affect the AF Spectrum trace.

## Frequency Modulation

### Conditions required to meet specification

- Peak deviation<sup>1</sup>:  $\geq 200$  Hz to 400 kHz
- Modulation index (ModIndex) = PeakDeviation/Rate = Beta: 0.2 to 2000
- Channel BW:  $\leq 1$  MHz
- Rate: 20 Hz to 50 kHz
- SINAD bandwidth: (Channel BW) / 2
- Single tone – sinusoid modulation
- Center Frequency (CF): 2 MHz to 3.5 GHz, DC coupled for CF < 20 MHz

Description	Specifications	Supplemental Information
<b>FM Deviation Accuracy</b> <sup>abc</sup>	$\pm(0.35\% \times \text{Reading} + 0.2\% \times \text{Rate})$	$\pm 0.2\% \times (\text{Deviation} + \text{Rate})$ (nominal)
<b>FM Rate Accuracy</b> <sup>d</sup>	$\pm(0.01\% \times \text{Reading})$	$\pm(0.001\% \times \text{Reading})$ (nominal)
<b>Carrier Frequency Error</b> <sup>ef</sup> (ModIndex $\leq 100$ )	$\pm(10 \text{ ppm} \times \text{Deviation} + 20 \text{ ppm} \times \text{Rate}) + \text{tfa}$	
<b>Carrier Power</b>		Same as <b>“Absolute Amplitude Accuracy”</b> on page 39 at all frequencies (nominal)

- a. This specification applies to the result labeled "(Pk-Pk)/2".
- b. For optimum measurement, ensure that the Channel BW is set wide enough to capture the significant RF energy. Setting the Channel BW too wide will result in measurement errors.
- c. Reading is a measured frequency peak deviation in Hz, and Rate is a modulation rate in Hz.
- d. Reading is a measured modulation rate in Hz.
- e. tfa = transmitter frequency  $\times$  frequency reference accuracy.
- f. Deviation is peak frequency deviation in Hz, and Rate is a modulation rate in Hz.

1. Peak deviation, modulation index ("beta"), and modulation rate are related by  $\text{PeakDeviation} = \text{ModIndex} \times \text{Rate}$ . Each of these has an allowable range, but all conditions must be satisfied at the same time. For example,  $\text{PeakDeviation} = 80$  kHz at  $\text{Rate} = 20$  Hz is not allowed, since  $\text{ModIndex} = \text{PeakDeviation}/\text{Rate}$  would be 4000, but ModIndex is limited to 2000. In addition, all significant sidebands must be contained in Channel BW. For FM, an approximate rule-of-thumb is  $2 \times [\text{PeakDeviation} + \text{Rate}] < \text{Channel BW}$ ; this implies that PeakDeviation might be large if the Rate is small, but both cannot be large at the same time.

## Frequency Modulation

Description	Specifications	Supplemental Information
<b>Post-Demod Distortion Residual<sup>a</sup></b>		
Distortion (SINAD) <sup>b</sup>	$0.5\% / (\text{ModIndex})^{1/2} + 0.1\%$	
THD	$0.3\% / (\text{ModIndex})^{1/2} + 0.02\%$	
<b>Post-Demod Distortion Accuracy</b>		
(Rate: 1 to 10 kHz, ModIndex: 0.2 to 100)		
Distortion (SINAD) <sup>b</sup>	$\pm(2\% \times \text{Reading} + \text{DistResidual})^c$	
THD	$\pm(2\% \times \text{Reading} + \text{DistResidual})^c$	
<b>Distortion Measurement Range</b>		
Distortion (SINAD) <sup>b</sup>		Residual to 100% (nominal)
THD <sup>d</sup>		Residual to 100% (nominal)
<b>AM Rejection<sup>e</sup></b> (50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW)	2.9 Hz FM peak	Applied AM signal Rate = 1 kHz, Depth = 50%
<b>Residual FM<sup>f</sup></b> (50 Hz HPF, 3 kHz LPF, any Channel BW)		1.0 Hz rms (nominal)
(50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW)	1.2 Hz rms	0.1 Hz rms (nominal)
(50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW, 750 $\mu$ S de-emph)		0.008 Hz rms (nominal)
<b>Hum &amp; Noise</b> (50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW, 750 $\mu$ S de-emph; relative to 3 kHz pk deviation)		93 dB (nominal)

- For optimum measurement, ensure that the Channel BW is set wide enough to capture the significant RF energy. Setting the Channel BW too wide will result in measurement errors.
- SINAD [dB] can be derived by  $20 \times \log_{10}(1 / \text{Distortion})$ .
- The DistResidual term of the Distortion Accuracy specification can increase the reading, but cannot reduce the reading.

## Analog Demodulation Measurement Application

### Frequency Modulation

- d. The measurement includes at most the 10th harmonic.
- e. AM rejection describes the instrument's FM reading for an input that is strongly AMed (with no FM); this specification includes contributions from residual FM.
- f. Residual FM describes the instrument's FM reading for an input that has no FM and no AM; this specification includes contributions from FM deviation accuracy.

## Amplitude Modulation

### Conditions required to meet specification

- Depth: 1% to 99%
- Channel BW:  $\leq 1$  MHz
- Rate: 50 Hz to 100 kHz
- SINAD bandwidth: (Channel BW) / 2
- Single tone - sinusoid modulation
- Center Frequency (CF): 500 kHz to 3.5 GHz, Channel BW  $< 2 \times (CF - 100$  kHz),  
DC coupled for CF  $< 20$  MHz

Description	Specifications	Supplemental Information
<b>AM Depth Accuracy<sup>ab</sup></b>	$\pm(0.1\% \times \text{Reading} + 0.05\%)$	Channel BW is set to 15 times of Rate (Rate $\leq 50$ kHz) or 10 times the Rate (50 kHz $<$ Rate $\leq 100$ kHz)  Same as “ <b>Absolute Amplitude Accuracy</b> ” on page 39 at all frequencies (nominal)
<b>AM Rate Accuracy<sup>c</sup></b> (Rate: 1 kHz to 1 MHz)	$\pm[(2.5 \text{ ppm} \times \text{Reading}) \times (100\% / \text{Depth})]$	
<b>Carrier Power</b>		

- a. This specification applies to the result labeled "(Pk-Pk)/2".  
b. Reading is a measured AM depth in %.  
c. Reading is a modulation rate in Hz and depth is in %.

## Amplitude Modulation

Description	Specifications	Supplemental Information
<b>Post-Demod Distortion Residual<sup>a</sup></b>		
Distortion (SINAD) <sup>b</sup>	$0.1\% \times (100\% / \text{Depth}) + 0.02\%$	
THD	$0.014\% \times (100\% / \text{Depth}) + 0.01\%$	
<b>Post-Demod Distortion Accuracy</b>		
(Rate: 1 to 10 kHz, Depth: 5 to 90%)		
Distortion (SINAD) <sup>b</sup>	$\pm(1\% \times \text{Reading} + \text{DistResidual})$	
THD	$\pm(1\% \times \text{Reading} + \text{DistResidual})$	
<b>Distortion Measurement Range</b>		
Distortion (SINAD) <sup>b</sup>		Residual to 100% (nominal)
THD		Residual to 100% (nominal)
<b>FM Rejection<sup>c</sup></b>	0.05% AM peak	Applied FM signal Rate = 1 kHz, Deviation = 50 kHz
(300 Hz HPF, 3 kHz LPF, 420 kHz Channel BW)		
<b>Residual AM<sup>d</sup></b>	0.02% AM rms	
(300 Hz HPF, 3 kHz LPF, 15 kHz Channel BW)		

- Channel BW is set to 15 times of Rate (Rate  $\leq$  50 kHz) or 10 times the Rate (50 kHz < Rate  $\leq$  100 kHz).
- SINAD [dB] can be derived by  $20 \times \log_{10}(1 / \text{Distortion})$ .
- FM rejection describes the instrument's AM reading for an input that is strongly FMed (and no AM); this specification includes contributions from residual AM.
- Residual AM describes the instrument's AM reading for an input that has no AM and no FM; this specification includes contributions from AM depth accuracy.

## Phase Modulation

### Conditions required to meet specification

- Peak deviation<sup>1</sup>: 0.2 to 100 rad
- Channel BW:  $\leq 1$  MHz
- Rate: 50 Hz to 50 kHz
- SINAD bandwidth: (Channel BW)/2
- Single tone – sinusoid modulation
- Center Frequency (CF): 2 MHz to 3.5 GHz, DC coupled for CF < 20 MHz

Description	Specifications	Supplemental Information
<b>PM Deviation Accuracy<sup>abc</sup></b> Rate: 100 Hz to 50 kHz	$\pm(0.1\% \times \text{Reading} + 2 \text{ mrad})$	Same as <b>"Absolute Amplitude Accuracy"</b> on page 39 at all frequencies (nominal).
<b>PM Rate Accuracy<sup>bd</sup></b> Rate: <1 kHz Rate: 1 kHz to 50 kHz <sup>e</sup>	$\pm(0.008 \text{ Hz} / \text{Deviation} + 0.003 \text{ Hz})$ $\pm(8 \text{ ppm} / \text{Deviation} + 3 \text{ ppm}) \times \text{Rate}$	
<b>Carrier Frequency Error<sup>bef</sup></b>	$\pm(1.5 \text{ ppm} \times \text{Deviation} + 5 \text{ ppm}) \times \text{Rate} + \text{tfa}$	
<b>Carrier Power</b>		

- a. This specification applies to the result labeled "(Pk-Pk)/2".
- b. For optimum measurement, ensure that the Channel BW is set wide enough to capture the significant RF energy. Setting the Channel BW too wide will result in measurement errors.
- c. Reading is the measured peak deviation in radians.
- d. Deviation is the peak deviation in radians.
- e. Rate is a modulation rate in Hz.
- f. tfa = transmitter frequency  $\times$  frequency reference accuracy.

1. PeakDeviation (for phase, in rads) and Rate are jointly limited to fit within the Channel BW. For PM, an approximate rule-of-thumb is  $2 \times [\text{PeakDeviation} + 1] \times \text{Rate} < \text{Channel BW}$ , such that most of the sideband energy is within the Channel BW.

## Phase Modulation

Description	Specifications	Supplemental Information
<b>Post-Demod Distortion Residual<sup>a</sup></b>		
Distortion (SINAD) <sup>bc</sup>	0.7% / Deviation + 0.2%	
THD <sup>b</sup>	0.05% / Deviation + 0.01%	
<b>Post-Demod Distortion Accuracy</b> (Rate: 1 to 10 kHz)		
Distortion (SINAD) <sup>c</sup>	$\pm(2\% \times \text{Reading} + \text{DistResidual})$	
THD	$\pm(2\% \times \text{Reading} + \text{DistResidual})$	
<b>Distortion Measurement Range</b>		
Distortion (SINAD) <sup>c</sup>		Residual to 100% (nominal)
THD		Residual to 100% (nominal)
<b>AM Rejection<sup>d</sup></b> (50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW)	3.6 mrad peak	Applied AM signal Rate = 1 kHz, Depth = 50%
Residual PM <sup>e</sup> (50 Hz HPF, 3 kHz LPF, 15 kHz Channel BW)	2.1 mrad rms	

- For optimum measurement, ensure that the Channel BW is set wide enough to capture the significant RF energy. Setting the Channel BW too wide will result in measurement errors.
- Deviation is a peak deviation in radians.
- SINAD [dB] can be derived by  $20 \times \log_{10}(1 / \text{Distortion})$ .
- AM rejection describes the instrument's PM reading for an input that is strongly AMed (with no PM); this specification includes contributions from residual PM.
- Residual PM describes the instrument's PM reading for an input that has no PM and no AM; this specification includes contributions from PM deviation accuracy.

## Analog Out

The "Analog Out" connector (BNC) is located at the analyzer's rear panel. It is a multi-purpose output, whose function depends on options and operating mode (active application). When the N9063A Analog Demod application is active, this output carries a voltage waveform reconstructed by a real-time hardware demodulator (designed to drive the "Demod to Speaker" function for listening). The processing path and algorithms for this output are entirely separate from those of the N9063A application itself; the Analog Out waveform is not necessarily identical the application's Demod Waveform.

Condition of "Open Circuit" is assumed for all voltage terms such as "Output range".

Description	Specifications	Supplemental Information
Bandwidth		$\leq 8$ MHz
Output impedance		50 $\Omega$ (nominal)
Output range		–1V to +1 V (Nominal)
AM scaling		
AM scaling factor		5 mV/%AM (nominal)
AM scaling tolerance		$\pm 10\%$ (nominal)
AM offset		0 V corresponds to carrier power as measured at setup <sup>a</sup>
FM scaling		
FM scaling factor		2 V/Channel BW (nominal), where Channel BW is settable by the user
FM scaling tolerance		$\pm 10\%$ (nominal)
FM scale adjust		User-settable factor, range from 0.5 to 10, default =1, applied to above FM scaling.
FM offset		
HPF off		0 V corresponds to SA tuned frequency, and Carrier Frequency Errors (constant frequency offset) are included (DC coupled)
HPF on		0 V corresponds to the mean of the waveform
PM scaling		
PM scaling factor		(1/ $\pi$ ) V/rad (nominal)
PM scaling tolerance		$\pm 10\%$ (nominal)
PM offset		0 V corresponds to mean phase

- a. For AM, the reference "unmodulated" carrier level is determined by a single "invisible" power measurement, of 2 ms duration, taken at setup. "Setup" occurs whenever a core parameter is changed, such as Center Frequency, modulation type, Demod Time, etc. Ideally, the RF input signal should be un-modulated at this time. However, if the AM modulating (audio) waveform is evenly periodic in 2 ms (i.e. multiples of 500 Hz, such as 1 kHz), the reference power measurement can be made with modulation applied. Likewise, if the AM modulating period is very short compared to 2ms (e.g. >5000 Hz), the reference power measurement error will be small.

## FM Stereo/Radio Data System (RDS) Measurements<sup>1</sup>

Description	Specifications	Supplemental Information
<b>FM Stereo Modulation Analysis Measurements</b>		
MXP view	RF Spectrum, AF Spectrum, Demod Waveform, FM Deviation (Hz) (Peak +, Peak-, (Pk-Pk)/2, RMS), Carrier Power (dBm), Carrier Frequency Error (Hz), SINAD (dB), Distortion (% or dB)	MPX consists of FM signal multiplexing with the mono signal (L+R), stereo signal (L-R), pilot signal (at 19 kHz) and optional RDS signal (at 57 kHz). <ul style="list-style-type: none"> <li>– SINAD MPX BW, default 53 kHz, range from 1 kHz to 58 kHz.</li> <li>– Reference Deviation, default 75 kHz, range from 15 kHz to 150 kHz.</li> </ul>
Mono (L+R) / Stereo (L-R) view	Demod Waveform, AF Spectrum, Carrier Power (dBm), Carrier Frequency Error (Hz), Modulation Rate	Mono Signal is Left + Right Stereo Signal is Left – Right
Left / Right view	Demod Waveform, AF Spectrum, Carrier Power (dBm), Carrier Frequency Error (Hz), Modulation Rate, SINAD (dB), Distortion (% or dB), THD (% or dB)	Post-demod settings: <ul style="list-style-type: none"> <li>– Highpass filter: 20, 50, or 300 Hz</li> <li>– Lowpass filter: 300 Hz, 3, 15, 80, or 300 kHz</li> <li>– Bandpass filter: A-Weighted, CCITT</li> <li>– De-Emphasis: 25, 50, 75 and 750 <math>\mu</math>s</li> </ul>
RDS / RBDS Decoding Results view	BLER basic tuning and switching information, radio text, program item number and slow labeling codes, clock time and date	BLER Block Count default 1E+8, range from 1 to 1E+16
Numeric Result view	MPX, Mono, Stereo, Left, Right, Pilot and RDS with FM Deviation result (Hz) of Peak+, (Pk-Pk)/2, RMS, Modulation Rate (Hz), SINAD (% or dB), THD (% or dB), Left to Right (dB), Mono to Stereo (dB), RF Carrier Power (dBm), RF Carrier Frequency Error (Hz), 38 kHz Carrier Phase Error (deg)	

1. Requires *Option N9063A-3FP*, which in turn requires that the instrument also has *Option N9063A-2FP* installed and licensed.

## 21 Noise Figure Measurement Application

This chapter contains specifications for the N9069A Noise Figure Measurement Application.

## General Specifications

Description	Specifications		Supplemental Information
<b>Noise Figure</b>  <10 MHz  10 MHz to 26.5 GHz and 26.5 to 50 GHz <sup>c</sup>  <b>Noise Source ENR</b>  4 to 6.5 dB  12 to 17 dB  20 to 22 dB	<b>Measurement Range</b>          0 to 20 dB  0 to 30 dB  0 to 35 dB	<b>Instrument Uncertainty<sup>e</sup></b>          ±0.02 dB  ±0.025 dB  ±0.03 dB	Uncertainty Calculator <sup>a</sup>  See note <sup>b</sup>  Internal and External preamplification recommended <sup>d</sup>

- The figures given in the table are for the uncertainty added by the X-Series Signal Analyzer instrument only. To compute the total uncertainty for your noise figure measurement, you need to take into account other factors including: DUT NF, Gain and Match, Instrument NF, Gain Uncertainty and Match; Noise source ENR uncertainty and Match. The computations can be performed with the uncertainty calculator included with the Noise Figure Measurement Personality. Go to **Mode Setup** then select **Uncertainty Calculator**. Similar calculators are also available on the Keysight web site; go to <http://www.keysight.com/find/nfu>.
- Uncertainty performance of the instrument is nominally the same in this frequency range as in the higher frequency range. However, performance is not warranted in this range. There is a paucity of available noise sources in this range, and the analyzer has poorer noise figure, leading to higher uncertainties as computed by the uncertainty calculator.
- At the highest frequencies, especially above 40 GHz, the only Keysight supra-26-GHz noise source, the 346CK01, often will not have enough ENR to allow for the calibration operation. Operation with "Internal Cal" is almost as accurate as with normal calibration, so the inability to use normal calibration does not greatly impact usefulness. Also, if the DUT has high gain, calibration has little effect on accuracy. In those rare cases when normal calibration is required, the Noisecom NC5000 and the NoiseWave NW346V do have adequate ENR for calibration.
- The NF uncertainty calculator can be used to compute the uncertainty. For most DUTs of normal gain, the uncertainty will be quite high without preamplification.
- "Instrument Uncertainty" is defined for noise figure analysis as uncertainty due to relative amplitude uncertainties encountered in the analyzer when making the measurements required for a noise figure computation. The relative amplitude uncertainty depends on, but is not identical to, the relative display scale fidelity, also known as incremental log fidelity. The uncertainty of the analyzer is multiplied within the computation by an amount that depends on the Y factor to give the total uncertainty of the noise figure or gain measurement. See Keysight App Note 57-2, literature number 5952-3706E for details on the use of this specification. Jitter (amplitude variations) will also affect the accuracy of results. The standard deviation of the measured result decreases by a factor of the square root of the Resolution Bandwidth used and by the square root of the number of averages. This application uses the 4 MHz Resolution Bandwidth as default because this is the widest bandwidth with uncompromised accuracy.

Noise Figure Measurement Application  
General Specifications

Description	Specifications	Supplemental Information
<b>Gain</b>		
Instrument Uncertainty <sup>a</sup>		DUT Gain Range = –20 to +40 dB
<10 MHz	±0.07 dB	See note <sup>b</sup>
10 MHz to 3.6 GHz		
3.6 GHz to 26.5 GHz		±0.11 dB additional <sup>c</sup> 95th percentile, 5 minutes after calibration
26.5 to 50 GHz		Nominally the same performance as for 3.6 to 26.5 GHz. Also, see footnote <a href="#">c</a> .

- “Instrument Uncertainty” is defined for gain measurements as uncertainty due to relative amplitude uncertainties encountered in the analyzer when making the measurements required for the gain computation. See Keysight App Note 57-2, literature number 5952-3706E for details on the use of this specification. Jitter (amplitude variations) will also affect the accuracy of results. The standard deviation of the measured result decreases by a factor of the square root of the Resolution Bandwidth used and by the square root of the number of averages. This application uses the 4 MHz Resolution Bandwidth as default since this is the widest bandwidth with uncompromised accuracy. Under difficult conditions (low Y factors), the instrument uncertainty for gain in high band can dominate the NF uncertainty as well as causing errors in the measurement of gain. These effects can be predicted with the uncertainty calculator.
- Uncertainty performance of the instrument is nominally the same in this frequency range as in the higher frequency range. However, performance is not warranted in this range. There is a paucity of available noise sources in this range, and the analyzer has poorer noise figure, leading to higher uncertainties as computed by the uncertainty calculator.
- For frequencies above 3.6 GHz, the analyzer uses a YIG-tuned filter (YTF) as a preselector, which adds uncertainty to the gain. When the Y factor is small, such as with low gain DUTs, this uncertainty can be greatly multiplied and dominate the uncertainty in NF (as the user can compute with the Uncertainty Calculator), as well as impacting gain directly. When the Y factor is large, the effect of IU of Gain on the NF becomes negligible. When the Y-factor is small, the non-YTF mechanism that causes Instrument Uncertainty for Gain is the same as the one that causes IU for NF with low ENR. Therefore, we would recommend the following practice: When using the Uncertainty Calculator for noise figure measurements above 3.6 GHz, fill in the IU for Gain parameter with the sum of the IU for NF for 4 – 6.5 dB ENR sources and the shown “additional” IU for gain for this frequency range. When estimating the IU for Gain for the purposes of a gain measurement for frequencies above 3.6 GHz, use the sum of IU for Gain in the 0.01 to 3.6 GHz range and the “additional” IU shown. You will find, when using the Uncertainty Calculator, that the IU for Gain is only important when the input noise of the spectrum analyzer is significant compared to the output noise of the DUT. That means that the best devices, those with high enough gain, will have comparable uncertainties for frequencies below and above 3.6 GHz. The additional uncertainty shown is that observed to be met in 95% of the frequency/instrument combinations tested with 95% confidence. It applies within five minutes of a calibration. It is not warranted.

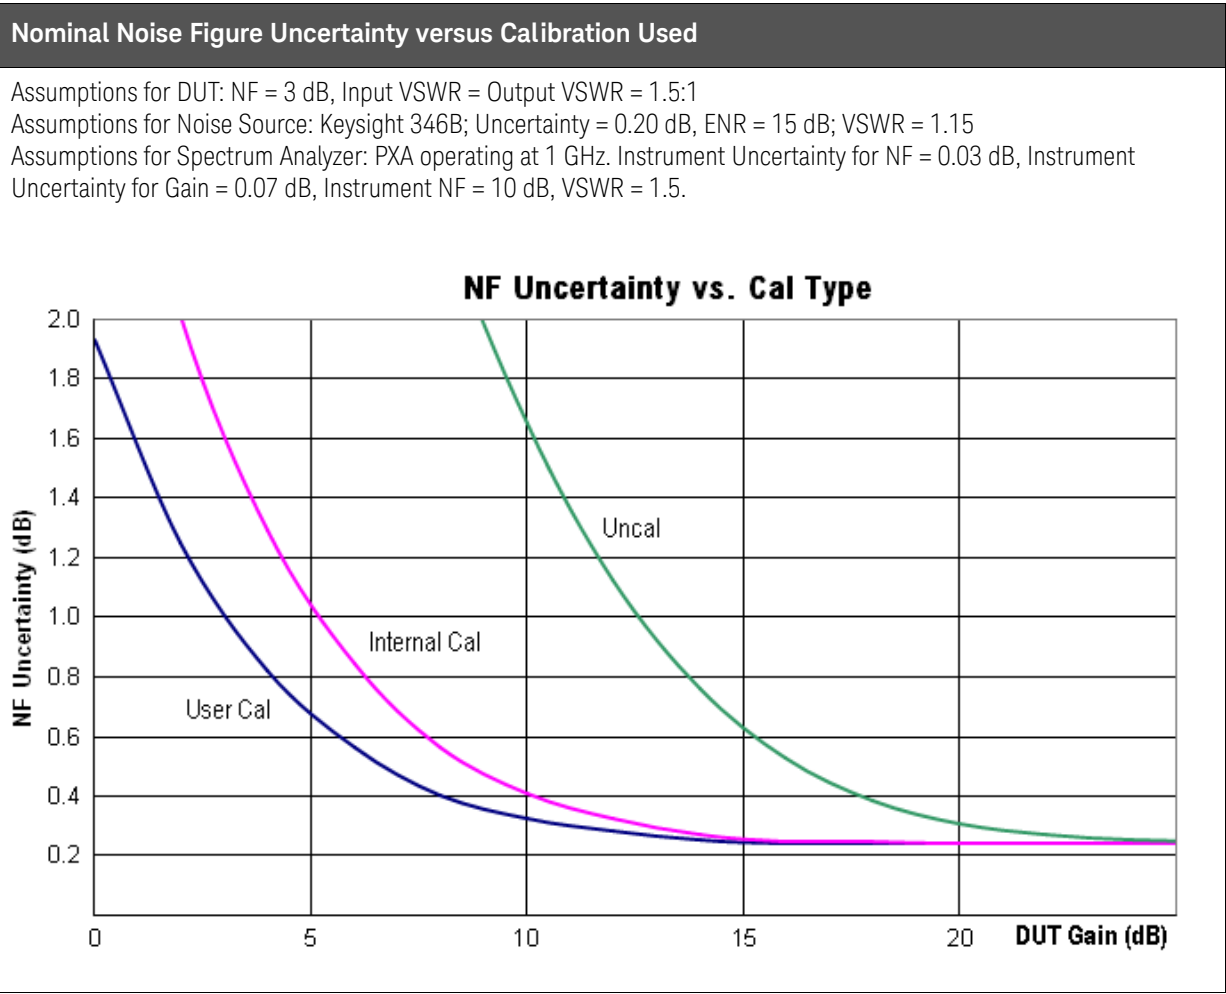

Noise Figure Measurement Application  
General Specifications

Description	Specifications	Supplemental Information
<b>Noise Figure Uncertainty Calculator<sup>a</sup></b>		
Instrument Noise Figure Uncertainty	See the Noise Figure table earlier in this chapter	
Instrument Gain Uncertainty	See the Gain table earlier in this chapter	
Instrument Noise Figure		See graphs of "Nominal Instrument Noise Figure"; Noise Figure is DANL + 176.24 dB (nominal) <sup>b</sup> Note on DC coupling <sup>cd</sup>
Instrument Input Match		See graphs: Nominal VSWR Note on DC coupling <sup>c</sup>
NFE Improvement/Internal Cal <sup>e</sup>		See <b>"Displayed Average Noise Level (DANL) (with Noise Floor Extension) Improvement"</b> on page 52.

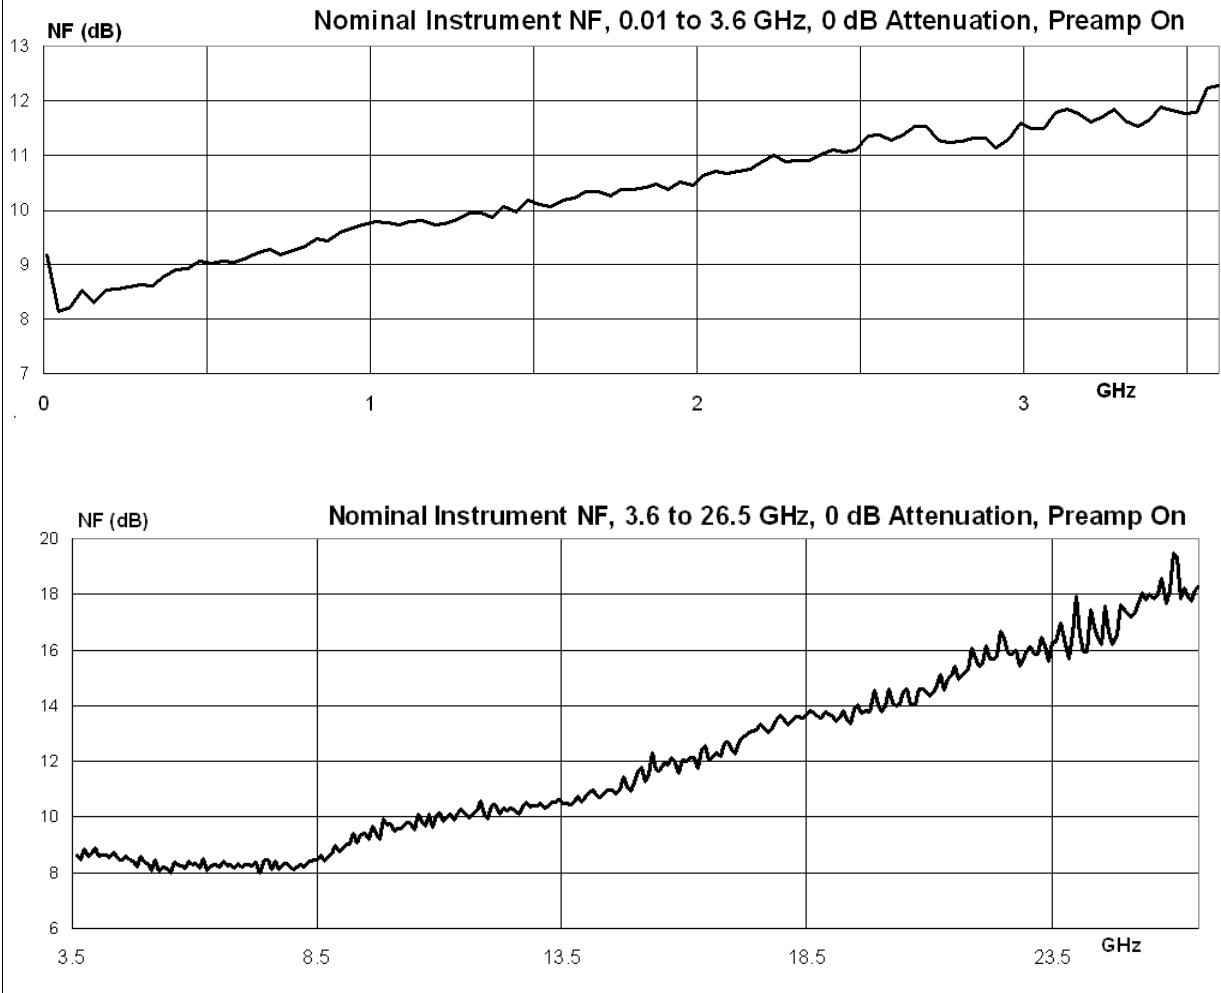

- The Noise Figure Uncertainty Calculator requires the parameters shown in order to calculate the total uncertainty of a Noise Figure measurement.
- Nominally, the noise figure of the spectrum analyzer is given by  

$$NF = D - (K - L + N + B)$$
where D is the DANL (displayed average noise level) specification,  
K is kTB (−173.98 dBm in a 1 Hz bandwidth at 290 K)  
L is 2.51 dB (the effect of log averaging used in DANL verifications)  
N is 0.24 dB (the ratio of the noise bandwidth of the RBW filter with which DANL is specified to an ideal noise bandwidth)  
B is ten times the base-10 logarithm of the RBW (in hertz) in which the DANL is specified. B is 0 dB for the 1 Hz RBW.  
The actual NF will vary from the nominal due to frequency response errors.
- The effect of AC coupling is negligible for frequencies above 40 MHz. Below 40 MHz, DC coupling is recommended for the best measurements.
- The instrument NF nominally degrades by 0.2 dB at 30 MHz and 1 dB at 10 MHz with AC coupling.
- Analyzers with NFE (Noise Floor Extension) use that capability in the Noise Figure Measurement Application to allow "Internal Cal" instead of user calibration. With internal calibration, the measurement is much better than an uncalibrated measurement but not as good as with user calibration. Calibration reduces the effect of the analyzer noise on the total measured NF. With user calibration, the extent of this reduction is computed in the uncertainty calculator, and will be on the order of 16 dB. With internal calibration, the extent of reduction of the effective noise level varies with operating frequency, its statistics are given on the indicated page. It is usually about half as effective as User Calibration, and much more convenient. For those measurement situations where the output noise of the DUT is 10 dB or more above the instrument input noise, the errors due to using an internal calibration instead of a user calibration are negligible.

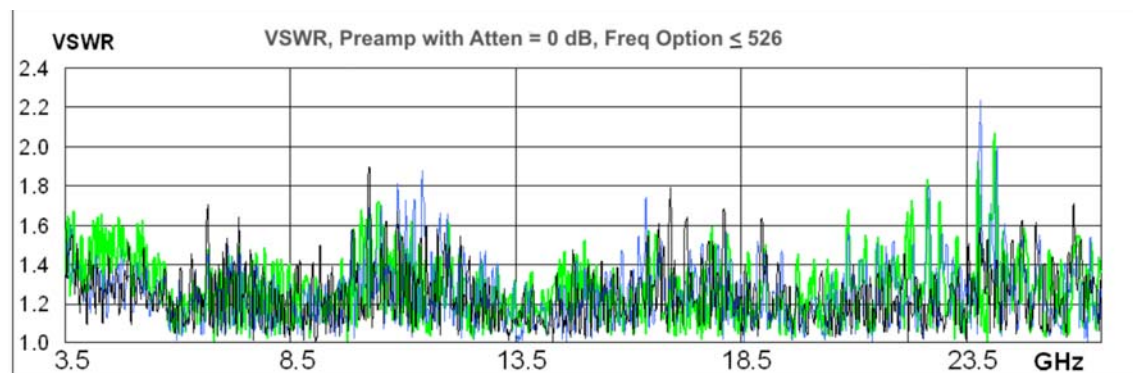

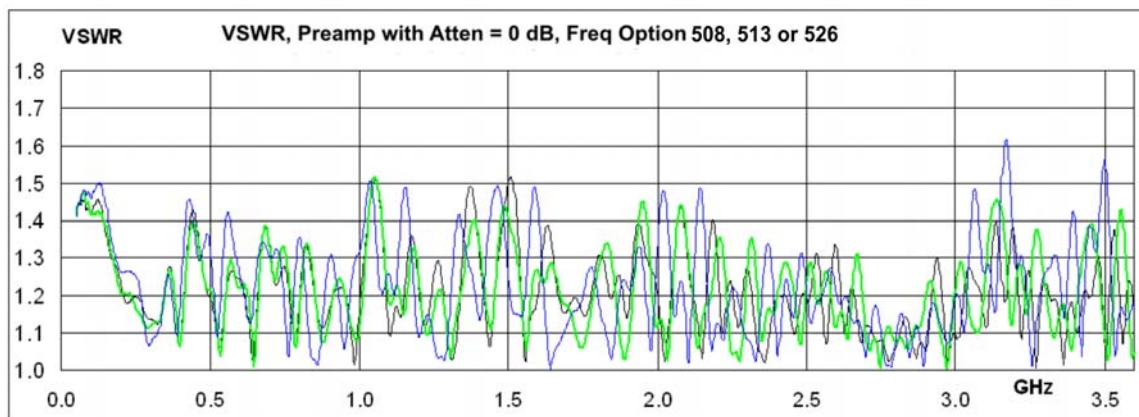

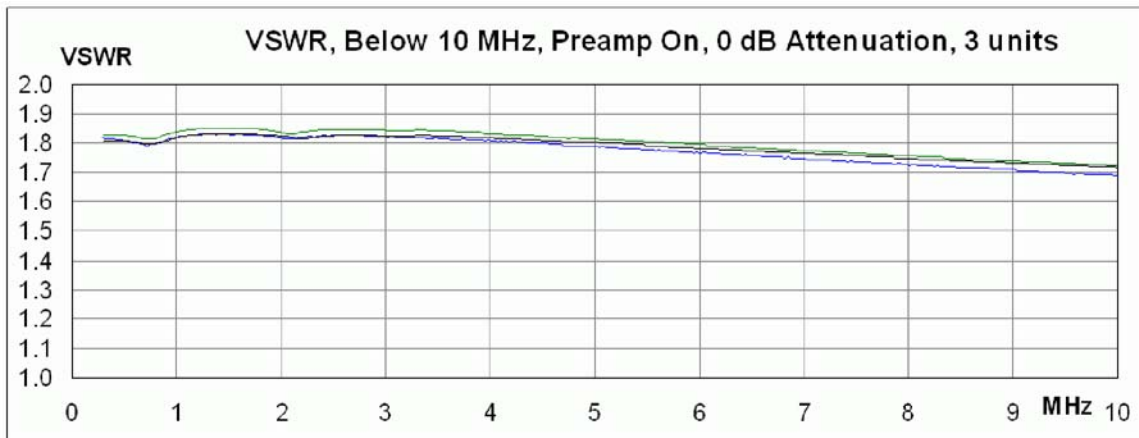

Description	Supplemental Information
<b>Uncertainty versus Calibration Options</b>	
User Calibration	Best uncertainties; Noise Figure Uncertainty Calculator applies
Uncalibrated	Worst uncertainties; noise of the analyzer input acts as a second stage noise on the DUT
Internal Calibration	Good uncertainties without the need of reconnecting the DUT and running a calibration. The uncertainty of the analyzer input noise model adds a second-stage noise power to the DUT that can be positive or negative. See the figure for example uncertainties.

Phase Noise Measurement Application  
General Specifications

Description	Specifications	Supplemental Information
<b>Measurement Accuracy</b>		
Phase Noise Density Accuracy <sup>ab</sup>		
Offset < 1 MHz	±0.16 dB	
Offset ≥ 1 MHz		
Non-overdrive case <sup>c</sup>	±0.16 dB	
With Overdrive		±0.39 dB (nominal)
RMS Markers		See equation <sup>d</sup>

- This does not include the effect of system noise floor. This error is a function of the signal (phase noise of the DUT) to noise (analyzer noise floor due to phase noise and thermal noise) ratio, SN, in decibels.  
The function is:  $\text{error} = 10 \times \log(1 + 10^{-\text{SN}/10})$   
For example, if the phase noise being measured is 10 dB above the measurement floor, the error due to adding the analyzer's noise to the UUT is 0.41 dB.
- Offset frequency errors also add amplitude errors. See the Offset frequency section, below.
- The phase noise density accuracy for the non-overdrive case is derived from warranted analyzer specifications. It applies whenever there is no overdrive. Overdrive occurs only for offsets of 1 MHz and greater, with signal input power greater than -10 dBm, and controls set to allow overdrive. The controls allow overdrive if the electronic attenuator option is licensed, Enable Elect Atten is set to On, Pre-Adjust for Min Clip is set to either Elect Atten Only or Elect-Mech Atten, and the carrier frequency plus offset frequency is <3.6 GHz.  
The controls also allow overdrive if (in the Meas Setup > Advanced menu) the Overdrive with Mech Atten is enabled. With the mechanical attenuator only, the overdrive feature can be used with carriers in the high band path (>3.6 GHz). To prevent overdrive in all cases, set the overdrive with Mech Atten to disabled and the Enable Elect Atten to Off.
- The accuracy of an RMS marker such as "RMS degrees" is a fraction of the readout. That fraction, in percent, depends on the phase noise accuracy, in dB, and is given by  $100 \times (10^{\text{PhaseNoiseDensityAccuracy} / 20} - 1)$ . For example, with +0.30 dB phase noise accuracy, and with a marker reading out 10 degrees RMS, the accuracy of the marker would be +3.5% of 10 degrees, or +0.35 degrees.

Phase Noise Measurement Application  
General Specifications

Description	Specifications	Supplemental Information
<b>Offset Frequency</b>  Range (Log Plot) Range (Spot Frequency)  Accuracy  Offset < 1 MHz  Offset ≥ 1 MHz	1 Hz to $(f_{\text{opt}} - f_{\text{CF}})^{\text{a}}$ 10 Hz up to $(f_{\text{opt}} - f_{\text{CF}})$	$f_{\text{opt}}$ : Maximum frequency determined by option <sup>b</sup> $f_{\text{CF}}$ : Carrier frequency of signal under test  Negligible error (nominal)  $\pm(0.5\% \text{ of offset} + \text{marker resolution})$ (nominal) 0.5% of offset is equivalent to 0.0072 octave <sup>c</sup>

- Option AFP required for 1 Hz offset.
- For example,  $f_{\text{opt}}$  is 3.6 GHz for *Option 503*.
- The frequency offset error in octaves causes an additional amplitude accuracy error proportional to the product of the frequency error and slope of the phase noise. For example, a 0.01 octave frequency error combined with an 18 dB/octave slope gives 0.18 dB additional amplitude error.

Description	Specifications	Supplemental Information
<b>Amplitude Repeatability</b>  (No Smoothing, all offsets, default settings, including averages = 10)		<1 dB (nominal) <sup>a</sup>

- Standard deviation. The repeatability can be improved with the use of smoothing and increasing the number of averages.

#### Nominal Phase Noise at Different Center Frequencies

- Pulse width >10  $\mu$ s, duty cycle = 10%, reference locked, Bessel filter Off.

Pulse Measurement Software  
General Specifications

c. Please consult the Product User's Manual for mathematical definitions of features provided by *Option 3FP*.

Description	Specifications	Supplemental Information
<b>Software Characteristics</b>		
Maximum Number of Traces	6 total	
Trace Operations	Raw data, Max Hold, Min Hold, average, add and subtract	
Maximum Number of Markers	10 (reference or delta)	
Maximum Time Record Length <sup>a</sup>	$T = 524,288 / (\text{span} \times 1.28)$	
Time Resolution	$t = 1 / (\text{span} \times 1.28)$	
Types of Triggers	Free Run, Level, External	
Waveform file types (export)	.csv (trace data) .bmp .jpg .gif .tif .png (images)	
Waveform file type (import)	.sdf	
Maximum Number of Pulses Analyzed <sup>b</sup>	1,000	
Maximum Number of Collected Pulses <sup>c</sup>	<200,000	

- a. The value displayed may not be realized based on certain sample rates.
- b. Continuous capture (gapless) assumes the number of pulses fit into a single record length. Some metrics may not be available depending on the number of frequency points/pulse.
- c. Non-continuous.

## 24 1xEV-DO Measurement Application

This chapter contains specifications for the N9076A 1xEV-DO measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

This application supports forward link radio configurations 1 to 5 and reverse link radio configurations 1–4. cdmaOne signals can be analyzed by using radio configuration 1 or 2.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Pow</b> (1.23 MHz Integration BW) Minimum power at RF input Absolute power accuracy <sup>a</sup> (20 to 30°C) Measurement floor	±0.61 dB	Input signal must not be bursted –50 dBm (nominal) ±0.19 dB (95th percentile) –90.8 dBm (nominal)

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b> Minimum power at RF Input Histogram Resolution	0.01 dB <sup>a</sup>	–40 dBm (nominal)

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Description	Specifications	Supplemental Information
<b>Occupied Band width</b> Minimum carrier power at RF Input Frequency accuracy		Input signal must not be bursted –40 dBm (nominal) ±2 kHz (nominal) RBW = 30 kHz, Number of Points = 1001, Span = 2 MHz

1xEV-DO Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Power vs. Time</b>		
Minimum power at RF input		–50 dBm (nominal)
Absolute power accuracy <sup>a</sup>		±0.19 dB (nominal)
Measurement floor		–90.8 dBm (nominal)
Relative power accuracy <sup>b</sup>		±0.11 dB (nominal)

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.
- b. The relative accuracy is the ratio of the accuracy of amplitude measurements of two different transmitter power levels. This specification is equivalent to the difference between two points on the scale fidelity curve shown in the XA Specifications Guide. Because the error sources of scale fidelity are almost all monotonic with input level, the relative error between two levels is nearly (within 0.10 dB) identical to the “error relative to –35 dBm” specified in the Guide.

1xEV-DO Measurement Application  
Measurements

Description		Specifications	Supplemental Information
<b>Spectrum Emission Mask and Adjacent Channel Power</b>			
Minimum power at RF Input			–20 dBm (nominal)
Dynamic Range, relative <sup>a</sup>			
<b>Offset Freq.</b>	<b>Integ BW</b>		
750 kHz	30 kHz	–85.9 dB	–89.6 dB (typical)
1980 kHz	30 kHz	–87.6 dB	–90.6 dB (typical)
Sensitivity, absolute			
<b>Offset Freq.</b>	<b>Integ BW</b>		
750 kHz	30 kHz		–106.7 dB (typical)
1980 kHz	30 kHz		–106.7 dB (typical)
Accuracy, relative			RBW method <sup>b</sup>
<b>Offset Freq.</b>	<b>Integ BW</b>		
750 kHz	30 kHz	±0.04 dB	
1980 kHz	30 kHz	±0.06 dB	

- a. The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. This specification is derived from other analyzer performance limitations such as third-order intermodulation, DANL and phase noise. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Mixer level is defined to be the input power minus the input attenuation.
- b. The RBW method measures the power in the adjacent channels within the defined resolution bandwidth. The noise bandwidth of the RBW filter is nominally 1.055 times the 3.01 dB bandwidth. Therefore, the RBW method will nominally read 0.23 dB higher adjacent channel power than would a measurement using the integration bandwidth method, because the noise bandwidth of the integration bandwidth measurement is equal to that integration bandwidth. For 1xEVDO ACPR measurements using the RBW method, the main channel is measured in a 3 MHz RBW, which does not respond to all the power in the carrier. Therefore, the carrier power is compensated by the expected under-response of the filter to a full width signal, of 0.15 dB. But the adjacent channel power is not compensated for the noise bandwidth effect. The reason the adjacent channel is not compensated is subtle. The RBW method of measuring ACPR is very similar to the preferred method of making measurements for compliance with FCC requirements, the source of the specifications for the 1xEVDO Spur Close specifications. ACPR is a spot measurement of Spur Close, and thus is best done with the RBW method, even though the results will disagree by 0.23 dB from the measurement made with a rectangular passband.

1xEV-DO Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Spurious Emissions</b>		
Dynamic Range <sup>a</sup> , relative (RBW=1 MHz)	88.8 dB	91.8 dB (typical)
Sensitivity <sup>b</sup> , absolute (RBW=1 MHz)	−88.5 dBm	−91.5 dBm (typical)
Accuracy, absolute		
20 Hz to 3.6 GHz		±0.19 dB (95th percentile)
3.5 to 8.4 GHz		±1.08 dB (95th percentile)
8.3 to 13.6 GHz		±1.48 dB (95th percentile)

- The dynamic range is specified at 12.5 MHz offset from center frequency with mixer level of 1 dB compression point, which will degrade accuracy by 1 dB.
- The sensitivity is specified at far offset from carrier, where phase noise does not contribute. You can derive the dynamic range at far offset from 1 dB compression mixer level and sensitivity.

## 1xEV-DO Measurement Application Measurements

Description	Specifications	Supplemental Information
<b>QPSK EVM</b>		
25 dBm ≤ ML <sup>a</sup> ≤ 15 dBm 20 to 30°C)		Set the attenuation to meet the Mixer Level requirement
EVM		
Operating range	0 to 25%	
Floor		1.5% (nominal)
Accuracy <sup>b</sup>	±1.0%	
I/Q origin offset		
DUT Maximum Offset		−10 dBc (nominal)
Analyzer Noise Floor		−50 dBc (nominal)
Frequency Error		
Range		±30 kHz (nominal)
Accuracy	±5 Hz + tfa <sup>c</sup>	

- a. ML (mixer level) is RF input power minus attenuation
- b. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  $\text{error} = \sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2} - \text{EVM}_{\text{UUT}}$ , where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent.
- c.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .

Description	Specifications	Supplemental Information
<b>Code Domain</b> (BTS Measurements  $-25 \text{ dBm} \leq \text{ML}^a \leq -15 \text{ dBm}$ 20 to 30°C)  Absolute power accuracy	          $\pm 0.15 \text{ dB}$	For pilot, 2 MAC channels, and 16 channels of QPSK data.  RF input power and attenuation are set to meet the Mixer Level range

- a. ML (mixer level) is RF input power minus attenuation.

Composite EVM		
Operating Range		0 to 25% (nominal)
Floor	1.5%	
Floor (with option BBA)		1.5% (nominal)
Accuracy <sup>b</sup>	$\pm 1.0$	
Composite Rho		
Range		0.94118 to 1.0 (nominal)
Floor		0.99978 (nominal)
Accuracy	$\pm 0.0010 \text{ dB}$ $\pm 0.0045 \text{ dB}$	At Rho 0.99751 (EVM 5%) At Rho 0.94118 (EVM 25%)
I/Q Origin Offset		
DUT Maximum Offset		-10 dBc (nominal)
Analyzer Noise Floor		-50 dBc (nominal)
Frequency Error		pilot, MAC, QPSK Data, 8PSK Data
Range		$\pm 400 \text{ Hz}$ (nominal)
Accuracy		$\pm 10 \text{ Hz} + \text{tfa}^c$

- ML (mixer level) is RF input power minus attenuation.
- The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  $\text{floorerror} = \sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2} - \text{EVM}_{\text{UUT}}$ , where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 7%, and the floor is 2.5%, the error due to the floor is 0.43%.
- $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .

## In-Band Frequency Range

Description	Specifications	Supplemental Information
<b>In-Band Frequency Range</b> (Access Network Only)		
Band Class 0	869 to 894 MHz	North American and Korean Cellular Bands
Band Class 1	1930 to 1990 MHz	North American PCS Band
Band Class 2	917 to 960 MHz	TACS Band
Band Class 3	832 to 869 MHz	JTACS Band
Band Class 4	1840 to 1870 MHz	Korean PCS Band
Band Class 6	2110 to 2170 MHz	IMT-2000 Band
Band Class 8	1805 to 1880 MHz	1800-MHz Band
Band Class 9	925 to 960 MHz	900-MHz Band

Description	Specifications	Supplemental Information
<b>Alternative Frequency Ranges</b> (Access Network Only)		
Band Class 5	421 to 430 MHz 460 to 470 MHz 480 to 494 MHz	NMT-450 Band
Band Class 7	746 to 764 MHz	North American 700-MHz Cellular Band

## 25 802.16 OFDMA Measurement Application

This chapter contains specifications for the N9075A 802.16 OFDMA measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

Information bandwidth is assumed to be 5 or 10 MHz unless otherwise explicitly stated.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b> Minimum power at RF Input Absolute power accuracy <sup>a</sup> (20 to 30°C, Atten = 10 dB) Measurement floor	   $\pm 0.63$ dB	  –35 dBm (nominal) $\pm 0.19$ dB (95th percentile)  –81.7 dB (nominal) at 10 MHz BW

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b> Histogram Resolution	 0.01 dB <sup>a</sup>	

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of the histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Description	Specifications	Supplemental Information
<b>Occupied Band width</b> Minimum power at RF Input Frequency Accuracy		 –30 dBm (nominal) $\pm 20$ kHz (nominal) at 10 MHz BW

802.16 OFDMA Measurement Application  
Measurements

Description			Specifications	Supplemental Information
<b>Adjacent Channel Power</b>				
Minimum power at RF Input				–36 dBm (nominal)
ACPR Accuracy				
<b>Radio</b>	<b>BW</b>	<b>Offset</b>		
MS	5 MHz	5 MHz	±0.06 dB	At ACPR –24 dBc with optimum mixer level <sup>a</sup>
MS	5 MHz	10 MHz	±0.11 dB	At ACPR –47 dBc with optimum mixer level <sup>b</sup>
MS	10 MHz	10 MHz	±0.07 dB	At ACPR –24 dBc with optimum mixer level <sup>c</sup>
MS	10 MHz	20 MHz	±0.16 dB	At ACPR –47 dBc with optimum mixer level <sup>b</sup>
BS	5 MHz	5 MHz	±0.17 dB	At ACPR –45 dBc with optimum mixer level <sup>d</sup>
BS	5 MHz	10 MHz	±0.15 dB	At ACPR –50 dBc with optimum mixer level <sup>b</sup>
BS	10 MHz	10 MHz	±0.23 dB	At ACPR –45 dBc with optimum mixer level <sup>e</sup>
BS	10 MHz	20 MHz	±0.23 dB	At ACPR –50 dBc with optimum mixer level <sup>b</sup>

- To meet this specified accuracy when measuring mobile station (MS) at –24 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –25 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –9 dBm, set the attenuation to 16 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- ACPR accuracy for this case is warranted when the input attenuator is set to give an average mixer level of –14 dBm.
- To meet this specified accuracy when measuring mobile station (MS) at –24 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –24 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –4 dBm, set the attenuation to 20 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- To meet this specified accuracy when measuring base station (BS) at –45 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –20 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –4 dBm, set the attenuation to 16 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- To meet this specified accuracy when measuring base station (BS) at –45 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –18 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –2 dBm, set the attenuation to 16 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.

802.16 OFDMA Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Spectrum Emission Mask</b>		
Dynamic Range, relative (5.05 MHz offset, 10 MHz BW <sup>ab</sup> )	82.2 dB	85.3 dB (typical)
Sensitivity, absolute (5.05 MHz offset, 10 MHz BW <sup>c</sup> )	–98.5 dBm	–101.5 dBm (typical)
Accuracy (5.05 MHz offset, 10 MHz BW)		
Relative <sup>d</sup>	±0.10 dB	
Absolute <sup>e</sup> (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 100 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about –16 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified with 100 kHz RBW, at a center frequency of 2 GHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- The absolute accuracy of SEM measurement is the same as the absolute accuracy of the spectrum analyzer. The numbers shown are for 0 to 3.6 GHz, with attenuation set to 10 dB.

802.16 OFDMA Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Spurious Emissions</b>  Accuracy (Attenuation = 10 dB)  Frequency Range 20 Hz to 3.6 GHz 3.5 to 8.4 GHz 8.3 to 13.6 GHz		±0.19 dB (95th percentile) ±1.08 dB (95th percentile) ±1.48 dB (95th percentile)

Description	Specifications	Supplemental Information
<b>Modulation Analysis</b>  Frequency Error: Accuracy RCE (EVM) <sup>c</sup> floor RF Input Freq CF ≤ 3.0 GHz 3.0 GHz < CF < 3.6 GHz Baseband IQ Input	±1 Hz <sup>a</sup> + tfa <sup>b</sup>    –50 dB	Input range within 5 dB of full scale, 20 to 30°C    –50 dB (nominal) –48 dB (nominal)

- a. This term includes an error due to the software algorithm. It is verified using a reference signal whose center frequency is intentionally shifted. This specification applies when the center frequency offset is within 5 kHz.
- b. tfa = transmitter frequency × frequency reference accuracy.
- c. RCE(EVM) specification applies when 10 MHz downlink reference signal including QPSK/16QAM/64QAM is tested. This requires that Equalizer Training is set to "Preamble, Data & Pilots" and Pilot Tracking is set to Phase/Timing on state. It also requires that Phase Noise optimizations mode is set to "Best close-in [offset < 140 kHz]".

# In-Band Frequency Range for Warranted Specifications

Band Class	Spectrum Range
1	2.300 to 2.400 GHz
2	2.305 to 2.320 GHz 2.345 to 2.360 GHz
3	2.496 to 2.690 GHz
4	3.300 to 3.400 GHz
6	1.710 to 2.170 GHz
7	0.698 to 0.862 GHz
8	1.710 to 2.170 GHz

## 26 Bluetooth Measurement Application

This chapter contains specifications for N9081A-2FP Bluetooth measurement application. Three standards, Bluetooth 2.1-basic rate, Bluetooth 2.1-EDR and Bluetooth 2.1-low energy are supported.

Three power classes, class 1, class 2 and class 3 are supported. Specifications for the three standards above are provided separately.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations. The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

## Basic Rate Measurements

Description	Specifications	Supplemental Information
<b>Output Power</b>		This measurement is a Transmit Analysis measurement and supports average and peak power in conformance with Bluetooth RF test specification 2.1.E.0.5.1.3.
Packet Type		DH1, DH3, DH5, HV3
Payload		PRBS9, BS00, BSFF, BS0F, BS55
Synchronization		RF Burst or Preamble
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Supported measurements		Average power, peak power
Range <sup>a</sup>		+30 dBm to -70 dBm
Absolute Power Accuracy <sup>b</sup> (20 to 30°C, Atten = 10 dB)		±0.20 dB(95th percentile)
Measurement floor		-70 dBm (nominal)

- When the input signal level is lower than -40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.
- Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Bluetooth Measurement Application  
Basic Rate Measurements

Description	Specifications	Supplemental Information
<b>Modulation Characteristics</b>		This measurement is a Transmit Analysis measurement and supports average and peak power in conformance with Bluetooth RF test specification 2.1.E.0.5.1.9.
Packet Type		DH1, DH3, DH5, HV3
Payload		BS0F, BS55
Synchronization		Preamble
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Supported measurements		Min/max $\Delta f1_{avg}$ min $\Delta f2_{max}$ (kHz) total $\Delta f2_{max} > \Delta f2_{max}$ lower limit (%) min of min $\Delta f2_{avg}$ / max $\Delta f1_{avg}$ pseudo frequency deviation ( $\Delta f1$ and $\Delta f2$ )
RF input level range <sup>a</sup>		+30 dBm to -70 dBm
Deviation range		$\pm 250$ kHz (nominal)
Deviation resolution		100 Hz (nominal)
Measurement Accuracy <sup>b</sup>		$\pm 100$ Hz + tfa <sup>c</sup> (nominal)

- When the input signal level is lower than -40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.
- Example, using 1 ppm as frequency reference accuracy of the analyzer, at frequency of 2.402 GHz, frequency accuracy would be in the range of  $\pm(2.402 \text{ GHz} \times 1 \text{ ppm}) \text{ Hz} \pm 100 \text{ Hz} = \pm 2402 \text{ Hz} \pm 100 \text{ Hz} = \pm 2502 \text{ Hz}$ .
- tfa = transmitter frequency  $\times$  frequency reference accuracy.

Description	Specifications	Supplemental Information
<b>Initial Carrier Frequency Tolerance</b>		This measurement is a Transmit Analysis measurement and supports average and peak power in conformance with Bluetooth RF test specification 2.1.E.0.5.1.10.
Packet Type		DH1, DH3, DH5, HV3
Payload		PRBS9, BS00, BSFF, BSOF, BS55
Synchronization		Preamble
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
RF input level range <sup>a</sup>		+30 dBm to –70 dBm
Measurement range		Nominal channel freq $\pm$ 100 kHz (nominal)
Measurement Accuracy <sup>b</sup>		$\pm 100$ Hz + tfa <sup>c</sup> (nominal)

- a. When the input signal level is lower than –40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.
- b. Example, using 1 ppm as frequency reference accuracy of the analyzer, at frequency of 2.402 GHz, frequency accuracy would be in the range of  $\pm(2.402 \text{ GHz} \times 1 \text{ ppm}) \text{ Hz} \pm 100 \text{ Hz} = \pm 2402 \text{ Hz} \pm 100 \text{ Hz} = \pm 2502 \text{ Hz}$ .
- c. tfa = transmitter frequency  $\times$  frequency reference accuracy.

Description	Specifications	Supplemental Information
<b>Carrier Frequency Drift</b>		This measurement is a Transmit Analysis measurement and supports average and peak power in conformance with Bluetooth RF test specification 2.1.E.0.5.1.11.
Packet Type		DH1, DH3, DH5, HV3
Payload		PRBS9, BS00, BSFF, BSOF, BS55
Synchronization		Preamble
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
RF input level range <sup>a</sup>		+30 dBm to –70 dBm
Measurement range		$\pm 100$ kHz (nominal)
Measurement Accuracy <sup>b</sup>		$\pm 100$ Hz + tfa <sup>c</sup> (nominal)

- a. When the input signal level is lower than –40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.

Bluetooth Measurement Application  
Basic Rate Measurements

- b. Example, using 1 ppm as frequency reference accuracy of the analyzer, at frequency of 2.402 GHz, frequency accuracy would be in the range of  $\pm(2.402 \text{ GHz} \times 1 \text{ ppm}) \text{ Hz} \pm 100 \text{ Hz} = \pm 2402 \text{ Hz} \pm 100 \text{ Hz} = \pm 2502 \text{ Hz}$ .
- c.  $tfa = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .

Description	Specifications	Supplemental Information
<b>Adjacent Channel Power</b>		This measurement is an Adjacent Channel Power measurement and is in conformance with Bluetooth RF test specification 2.1.E.0.5.1.8.
Packet Type		DH1, DH3, DH5, HV3
Payload		PRBS9, BS00, BSFF, BSOF, BS55
Synchronization		None
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Measurement Accuracy <sup>a</sup>		Dominated by the variance of measurements <sup>b</sup>

- a. The accuracy is for absolute power measured at 2.0 MHz offset and other offsets (offset = K MHz, K = 3,...,78).
- b. The measurement at these offsets is usually the measurement of noise-like signals and therefore has considerable variance. For example, with 100 ms sweeping time, the standard deviation of the measurement is about 0.5 dB. In comparison, the computed uncertainties of the measurement for the case with CW interference is only  $\pm 0.20 \text{ dB}$ .

## Low Energy Measurements

Description	Specifications	Supplemental Information
<b>Output Power</b>		This measurement is a Transmit Analysis measurement and supports average and peak power in conformance with Bluetooth RF test specification LE.RF-PHY.TS/0.7d2.6.2.1.
Packet Type		Reference type

- b. The measurement at these offsets is usually the measurement of noise-like signals and therefore has considerable variance. For example, with 100 ms sweeping time, the standard deviation of the measurement is about 0.5 dB. In comparison, the computed uncertainties of the measurement for the case with CW interference is only  $\pm 0.20 \text{ dB}$ .

## Enhanced Data Rate (EDR) Measurements

Description	Specifications	Supplemental Information
<b>EDR Relative Transmit Power</b>		This measurement is a Transmit Analysis measurement and supports average and peak power in conformance with Bluetooth RF test specification 2.1.E.0.5.1.12.
Packet Type		2-DH1, 2-DH3, 2-DH5, 3-DH1, 3-DH3, 3-DH5
Payload		PRBS9, BS00, BSFF, BS55
Synchronization		DPSK synchronization sequence
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Supported measurements		Power in GFSK header, power in PSK payload, relative power between GFSK header and PSK payload
Range <sup>a</sup>		+30 dBm to –70 dBm
Absolute Power Accuracy <sup>b</sup> (20 to 30°C, Atten = 10 dB)		±0.20 dB(95th percentile)
Measurement floor		–70 dBm (nominal)

- When the input signal level is lower than –40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.
- Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Bluetooth Measurement Application  
Enhanced Data Rate (EDR) Measurements

Description	Specifications	Supplemental Information
<b>EDR Modulation Accuracy</b>		This measurement is a Transmit Analysis measurement and is in conformance with Bluetooth RF test specification 2.1.E.0.5.1.13
Packet Type		2-DH1, 2-DH3, 2-DH5, 3-DH1, 3-DH3, 3-DH5
Payload		PRBS9, BS00, BSFF, BS55
Synchronization		DPSK synchronization sequence
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Supported measurements		rms DEVM peak DEVM, 99% DEVM
RF input level range <sup>a</sup>		+30 dBm to -70 dBm
RMS DEVM		
Range	0 to 12%	
Floor	1.5%	
Accuracy <sup>b</sup>	1.2%	

- a. When the input signal level is lower than -40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.
- b. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  

$$\text{error} = \sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2} - \text{EVM}_{\text{UUT}}$$
where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent

Synchronization		DPSK synchronization sequence
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Supported measurements		Worst case initial frequency error( $\omega_i$ ) for all packets (carrier frequency stability), worst case frequency error for all blocks ( $\omega_o$ ), ( $\omega_o + \omega_i$ ) for all blocks
RF input level range <sup>a</sup>		+30 dBm to -70 dBm
Carrier Frequency Stability and Frequency Error <sup>b</sup>		$\pm 100 \text{ Hz} + \text{tfa}^c$ (nominal)

- When the input signal level is lower than -40 dBm, the analyzer's preamp should be turned on and the attenuator set to 0 dB.
- Example, using 1 ppm as frequency reference accuracy of the analyzer, at frequency of 2.402 GHz, frequency accuracy would be in the range of  $\pm(2.402 \text{ GHz} \times 1 \text{ ppm}) \text{ Hz} \pm 100 \text{ Hz} = \pm 2402 \text{ Hz} \pm 100 \text{ Hz} = \pm 2502 \text{ Hz}$ .
- tfa = transmitter frequency  $\times$  frequency reference accuracy.

Bluetooth Measurement Application  
Enhanced Data Rate (EDR) Measurements

Description	Specifications	Supplemental Information
<b>EDR In-band Spurious Emissions</b>		This measurement is an EDR in-band spur emissions and is in conformance with Bluetooth RF test specification 2.1.E.0.5.1.15.
Packet Type		2-DH1, 2-DH3, 2-DH5, 3-DH1, 3-DH3, 3-DH5
Payload		PRBS9, BS00, BSFF, BS55
Synchronization		DPSK synchronization sequence
Trigger		External, RF Burst, Periodic Timer, Free Run, Video
Measurement Accuracy <sup>a</sup>		
Offset Freq = 1 MHz to 1.5 MHz		Dominated by ambiguity of the measurement standards <sup>b</sup>
Offset Freq = other offsets (2 MHz to 78 MHz)		Dominated by the variance of measurements <sup>c</sup>

- For offsets from 1 MHz to 1.5 MHz, the accuracy is the relative accuracy which is the adjacent channel power (1 MHz to 1.5 MHz offset) relative to the reference channel power (main channel). For other offsets (offset = K MHz, K= 2,...,78), the accuracy is the power accuracy of the absolute alternative channel power.
- The measurement standards call for averaging the signal across 3.5  $\mu$ s apertures and reporting the highest result. For common impulsive power at these offsets, this gives a variation of result with the time location of that interference that is 0.8 dB peak-to-peak and changes with a scallop shape with a 3.5  $\mu$ s period. Uncertainties in the accuracy of measuring CW-like relative power at these offsets are nominally only  $\pm 0.03$  dB, but observed variations of the measurement algorithm used with impulsive interference are similar to the scalloping error.
- The measurement at these offsets is usually the measurement of noise-like signals and therefore has considerable variance. For example, with a 1.5 ms packet length, the standard deviation of the measurement of the peak of ten bursts is about 0.6 dB. In comparison, the computed uncertainties of the measurement for the case with CW interference is only  $\pm 0.20$  dB.

## In-Band Frequency Range

Description	Specifications	Supplemental Information
<b>Bluetooth Basic Rate and Enhanced Data Rate (EDR) System</b>	2.400 to 2.4835 GHz (ISM radio band)	$f = 2402 + k \text{ MHz}$ , $k = 0, \dots, 78$ (RF channels used by Bluetooth)
<b>Bluetooth Low Energy System</b>	2.400 to 2.4835 GHz (ISM radio band)	$f = 2402 + k \times 2 \text{ MHz}$ , $k = 0, \dots, 39$ (RF channels used by Bluetooth)

## 27 cdma2000 Measurement Application

This chapter contains specifications for the N9072A, cdma2000 measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

This application supports forward link radio configurations 1 to 5 and reverse link radio configurations 1–4. cdmaOne signals can be analyzed by using radio configuration 1 or 2.

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description		Specifications	Supplemental Information
<b>Adjacent Channel Power<sup>a</sup></b>			
Minimum power at RF input			–36 dBm (nominal)
Dynamic range			Referenced to average power of carrier in 1.23 MHz bandwidth
<b>Offset Freq</b>	<b>Integ BW</b>		
750 kHz	30 kHz	–89.9 dBc	–89.5 dBc (typical)
1980 kHz	30 kHz	–87.6 dBc	–90.6 dBc (typical)
ACPR Relative Accuracy			RBW method <sup>b</sup>
Offsets ≤ 750 kHz		±0.04 dB	
Offsets ≥ 1.98 MHz		±0.06 dB	
Absolute Accuracy		±0.62 dB	±0.30 dB (at 95th percentile confidence)
Sensitivity			–106.7 dBm (typical)

a. ACP test items compliance the limits of conducted spurious emission specification defined in 3GPP2 standards

b. The RBW method measures the power in the adjacent channels within the defined resolution bandwidth. The noise bandwidth of the RBW filter is nominally 1.055 times the 3.01 dB bandwidth. Therefore, the RBW method will nominally read 0.23 dB higher adjacent channel power than would a measurement using the integration bandwidth method, because the noise bandwidth of the integration bandwidth measurement is equal to that integration bandwidth. For cdma2000 ACP measurements using the RBW method, the main channel is measured in a 3 MHz RBW, which does not respond to all the power in the carrier. Therefore, the carrier power is compensated by the expected under-response of the filter to a full width signal, of 0.15 dB. But the adjacent channel power is not compensated for the noise bandwidth effect.

The reason the adjacent channel is not compensated is subtle. The RBW method of measuring ACP is very similar to the preferred method of making measurements for compliance with FCC requirements, the source of the specifications for the cdma2000 Spur Close specifications. ACP is a spot measurement of Spur Close, and thus is best done with the RBW method, even though the results will disagree by 0.23 dB from the measurement made with a rectangular passband.

Description	Specification	Supplemental Information
<b>Power Statistics CCDF</b>  Histogram Resolution <sup>a</sup>	0.01 dB	

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Description	Specification	Supplemental Information
<b>Occupied Band width</b>  Minimum carrier power at RF Input  Frequency accuracy		–30 dBm (nominal)  ±2 kHz (nominal) RBW = 30 kHz, Number of Points = 1001, Span = 2 MHz

Description	Specifications	Supplemental Information
<b>Spectrum Emission Mask<sup>a</sup></b>		
Dynamic Range, relative		
750 kHz offset	85.9 dB	89.5 dB (typical)
1980 kHz offset	87.6 dB	90.6 dB (typical)
Sensitivity, absolute <sup>b</sup>		
750 kHz offset	−103.7 dBm	−106.7 dBm (typical)
1980 kHz offset	−103.7 dBm	−106.7 dBm (typical)
Accuracy		
750 kHz offset		
Relative <sup>c</sup>	±0.04 dB	
Absolute <sup>d</sup> 20 to 30°C	±0.62 dB	±0.21 dB (at 95th percentile)
1980 kHz offset		
Relative <sup>c</sup>	±0.06 dB	
Absolute <sup>d</sup> 20 to 30°C	±0.62 dB	±0.21 dB (at 95th percentile)

- SEM test items compliance the limits of conducted spurious emission specification defined in 3GPP2 standards.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified for the default 30 kHz RBW, at a center frequency of 2 GHz.
- The relative accuracy is a measure of the ration of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are near the regulatory limits of −25 dBc at 750 kHz offset and −60 dBc at 1980 kHz offset.
- The absolute accuracy of SEM measurement is the same as the absolute accuracy of the spectrum analyzer. See Absolute Amplitude Accuracy for more information. The numbers shown are for 0 to 3.6 GHz, with attenuation set to 10 dB.

Description	Specifications	Supplemental Information
<b>Spurious Emissions</b>		
Dynamic Range <sup>a</sup> , relative (RBW=1 MHz)	88.8 dB	91.8 dB (typical)
Sensitivity <sup>b</sup> , absolute (RBW=1 MHz)	–88.5 dB	–91.5 dBm (typical)
Accuracy, absolute		
Attenuation = 10 dB		
9 kHz to 3.6 GHz		±0.19 dB (95th percentile)
3.5 to 8.4 GHz		±1.08 dB (95th percentile)
8.3 to 13.6 GHz		±1.48 dB (95th percentile)

- The dynamic range is specified at 12.5 MHz offset from center frequency with mixer level of 1 dB compression point, which will degrade accuracy by 1 dB.
- The sensitivity is specified at far offset from carrier, where phase noise does not contribute. You can derive the dynamic range at far offset from 1 dB compression mixer level and sensitivity.

[illegible]

a. ML (mixer level) is RF input power minus attenuation.

Description	Specifications	Supplemental Information
<b>QPSK EVM</b>		
( $-25 \text{ dBm} \leq \text{ML}^{\text{a}} \leq -15 \text{ dBm}$ 20 to 30°C)		RF input power and attenuation are set to meet the Mixer Level range
EVM		
Range	0 to 25%	
Floor		1.5% (nominal)
Accuracy <sup>b</sup>	$\pm 1.0\%$	
I/Q origin offset		
DUT Maximum Offset		-10 dBc (nominal)
Analyzer Noise Floor		-50 dBc (nominal)
Frequency Error		
Range		$\pm 30 \text{ kHz}$ (nominal)
Accuracy	$\pm 5 \text{ Hz} + \text{tfa}^{\text{c}}$	

- a. ML (mixer level) is RF input power minus attenuation.
- b. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  $\text{error} = \sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2} - \text{EVM}_{\text{UUT}}$ , where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent.
- c.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$

Description	Specifications	Supplemental Information
<b>Modulation Accuracy (Composite Rho)</b>		Set the attenuation to meet the Mixer Level requirement. Specifications apply to BTS for 9 active channels as defined in 3GPP2
(BTS Measurements −25 dBm ≤ ML <sup>a</sup> ≤ −15 dBm 20 to 30°C)		RF input power and attenuation are set to meet the Mixer Level range

In-Band Frequency Range

## 28 CMMB Measurement Application

This chapter contains specifications for the *N6158A*, CMMB measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

The specifications apply to carrier frequencies below 2 GHz.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b> (8 MHz Integration BW) Minimum power at RF Input Absolute Power Accuracy <sup>a</sup> (20 to 30°C) Measurement floor	±0.61 dB	Input signal must not be bursted -50 dBm (nominal) ±0.19 dB (95th percentile) -85.7 dB

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Channel Power with Shoulder Attenuation View</b> (7.512 MHz Integration BW, ML = -14 dBm, Shoulder Offset = 4.2 MHz) Dynamic Range, relative <sup>a</sup>	98.4 dB	Input signal must not be bursted 103.7 dB (typical)

- a. The dynamic range specification is the ratio of the channel power to the power in the offset and region specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. This specification is derived from other analyzer performance limitations such as third-order intermodulation, DANL and phase noise. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Mixer level is defined to be the input power minus the input attenuation.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b> Minimum power at RF Input Histogram Resolution	0.01 dB <sup>a</sup>	-50 dBm (nominal)

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

CMMB Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Adjacent Channel Power</b>  Minimum power at RF Input  ACPR Accuracy <sup>a</sup> (7.512 MHz noise bandwidth method = IBW Offset Freq = 8 MHz)	       $\pm 0.18$ dB	       –36 dBm (nominal)  At ACPR –45 dBc with optimum mixer level. <sup>b</sup>

- a. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately  $-37 \text{ dBm} - (\text{ACPR}/3)$ , where the ACPR is given in (negative) decibels.
- b. To meet this specified accuracy when measuring transmitter at –45 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –20 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –4 dBm, set the attenuation to 16 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.

Absolute (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 3.9 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about -14 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 3.9 kHz RBW, at a center frequency of 666 MHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- This dynamic range specification applies for the optimum mixer level, which is about -11 dBm. Mixer level is defined to be the average input power minus the input attenuation.

## 29 Digital Cable TV Measurement Application

This chapter contains specifications for the *N6152A*, Digital Cable TV measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

The specifications apply to carrier frequencies below 1 GHz.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b> (8.0 MHz Integration BW) Minimum power at RF Input Absolute Power Accuracy <sup>a</sup> (20 to 30°C) Measurement floor	$\pm 0.61$ dB	Input signal must not be bursted  –50 dBm (nominal)  $\pm 0.19$ dB (95th percentile)  –85.7 dBm (typical)

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b> Minimum power at RF Input Histogram Resolution	$0.01$ dB <sup>a</sup>	–50 dBm (nominal)

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Digital Cable TV Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Adjacent Channel Power</b> Minimum power at RF Input  <b>ACPR Accuracy<sup>a</sup></b>  Offset Freq 8 MHz	       ±0.21 dB	–36 dBm (nominal)  8.0 MHz noise bandwidth method = IBW  At ACPR –45 dBc with optimum mixer level <sup>b</sup>

- a. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately –37 dBm – (ACPR/3), where the ACPR is given in (negative) decibels.
- b. To meet this specified accuracy when measuring transmitter at –45 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –20 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –3 dBm, set the attenuation to 17 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.

<b>DVB-C 64QAM EVM</b>		
(ML <sup>a</sup> = -20 dBm 20 to 30°C, CF ≤1 GHz)		Modulation Rate = 64 QAM Symbol Rate = 6.9 MHz
EVM (Smax)		
Operating range		0 to 5%
Floor	0.46%	Adaptive EQ Off
MER		
Operating range		≥22 dB
Floor	43 dB	Adaptive EQ Off
Frequency Error <sup>b</sup>		
Range		-150 kHz to 150 kHz
Accuracy		±10 Hz + tfa <sup>c</sup>
Quad Error		
Range		-5° to +5°
Gain Imbalance		
Range		-1 to +1 dB
BER Before Reed-Solomon		For DVB-C (J.83 Annex A/C) only
Range		0 to 1.0×10 <sup>-3</sup>
Packet Error Ratio		For DVB-C (J.83 Annex A/C) only
Range		0 to 1.0×10 <sup>-1</sup>

- ML (mixer level) is RF input power minus attenuation
- The accuracy specification applies at the EVM = 1%.
- $tfa = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .

## 30 DTMB Measurement Application

This chapter contains specifications for the *N6156A*, DTMB measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

The specifications apply to carrier frequencies below 2 GHz.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b> (8 MHz Integration BW) Minimum power at RF Input Absolute Power Accuracy <sup>a</sup> (20 to 30°C) Measurement floor	±0.61 dB	Input signal must not be bursted -50 dBm (nominal) ±0.19 dB (95th percentile) -85.7 dBm (typical)

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Channel Power with Shoulder Attenuation View</b> (7.56 MHz Integration BW, ML = -14 dBm, Shoulder Offset = 4.2 MHz) Dynamic Range, relative <sup>a</sup>	98.4 dB	Input signal must not be bursted 103.7 dB (typical)

- a. The dynamic range specification is the ratio of the channel power to the power in the offset and region specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. This specification is derived from other analyzer performance limitations such as third-order intermodulation, DANL and phase noise. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Mixer level is defined to be the input power minus the input attenuation.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b> Minimum power at RF Input Histogram Resolution	0.01 dB <sup>a</sup>	-50 dBm (nominal)

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

DTMB Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Adjacent Channel Power</b> Minimum power at RF Input  <b>ACPR Accuracy<sup>a</sup></b>	   $\pm 0.18$ dB	 –36 dBm (nominal)  RRC weighted, 7.56 MHz noise bandwidth method = IBW, Offset Freq = 8 MHz, At ACPR –45 dBc with optimum mixer level <sup>b</sup>

- a. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately  $-37 \text{ dBm} - (\text{ACPR}/3)$ , where the ACPR is given in (negative) decibels.
- b. To meet this specified accuracy when measuring transmitter at –45 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –20 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –4 dBm, set the attenuation to 16 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.

Absolute (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)
10 MHz offset		
Dynamic Range, relative <sup>e</sup>	100.8 dB	106.1 dB (typical)
Sensitivity, absolute	-114.5 dBm	-118.5 dBm (typical)
Accuracy		
Relative	±0.12 dB	
Absolute (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 3.9 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about -14 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 3.9 kHz RBW, at a center frequency of 474 MHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- This dynamic range specification applies for the optimum mixer level, which is about -11 dBm. Mixer level is defined to be the average input power minus the input attenuation.

## 32 GSM/EDGE Measurement Application

This chapter contains specifications for the N9071A GSM/EDGE/EDGE Evolution Measurement Application. For EDGE Evolution (EGPRS2) including Normal Burst (16QAM/32QAM) and High Symbol Rate (HSR) Burst, option 3FP is required.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

- a. EVM and frequency error specifications apply when the Burst Sync is set to Training Sequence.
- b. The definition of accuracy for the purposes of this specification is how closely the result meets the expected result. That expected result is 0.975 times the actual RMS EVM of the signal, per 3GPP TS 45.005, annex G.
- c. This term includes an error due to the software algorithm. The accuracy specification applies when EVM is less than 1.5%.
- d.  $tfa = \text{transmitter frequency} \times \text{frequency reference accuracy}$
- e. The accuracy specification applies when the Burst Sync is set to Training Sequence, and Trigger is set to External Trigger.

GSM/EDGE Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Power vs. Time</b> <i>and</i> <b>EDGE Power vs. Time</b>  Minimum carrier power at RF Input for GSM and EDGE  Absolute power accuracy for in-band signal (excluding mismatch error) <sup>a</sup>  <b>Power Ramp Relative Accuracy</b>  Accuracy Measurement floor	          $\pm 0.11$ dB -95 dBm	GMSK modulation (GSM) $3\pi/8$ shifted 8PSK modulation, $3\pi/4$ shifted QPSK, $\pi/4$ shifted 16QAM, $-\pi/4$ shifted 32QAM modulation in NSR/HSR (EDGE)  Measures mean transmitted RF carrier power during the useful part of the burst (GSM method) and the power vs. time ramping. 510 kHz RBW  -35 dBm (nominal)  -0.11 $\pm$ 0.19 dB (95th percentile)  Referenced to mean transmitted power

- a. The power versus time measurement uses a resolution bandwidth of about 510 kHz. This is not wide enough to pass all the transmitter power unattenuated, leading the consistent error shown in addition to the uncertainty. A wider RBW would allow smaller errors in the carrier measurement, but would allow more noise to reduce the dynamic range of the low-level measurements. The measurement floor will change by  $10 \times \log(\text{RBW}/510 \text{ kHz})$ . The average amplitude error will be about  $-0.11 \text{ dB} \times ((510 \text{ kHz}/\text{RBW})^2)$ . Therefore, the consistent part of the amplitude error can be eliminated by using a wider RBW.

GSM/EDGE Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Phase and Frequency Error</b>		GMSK modulation (GSM)
Carrier power range at RF Input		Specifications based on 3GPP essential conformance requirements, and 200 bursts
Phase error <sup>a</sup> , rms		+27 to –45 dBm (nominal)
Floor	0.5°	
Floor (Baseband IQ Input)		0.3° (nominal)

Analyzer Noise Floor		–50 dBc (nominal)
Trigger to T0 time offset (Relative accuracy <sup>d</sup> )		±5.0 ns (nominal)

- a. Phase error and frequency error specifications apply when the Burst Sync is set to Training Sequence.
- b. This term includes an error due to the software algorithm. The accuracy specification applies when RMS phase error is less than 1°.
- c. tfa = transmitter frequency × frequency reference accuracy
- d. The accuracy specification applies when the Burst Sync is set to Training Sequence, and Trigger is set to External Trigger.

Description	Specifications	Supplemental Information
<b>Output RF Spectrum (ORFS)</b> <i>and</i> <b>EDGE Output RF Spectrum</b>  Minimum carrier power at RF Input  ORFS Relative RF Power Uncertainty <sup>b</sup> Due to modulation  Offsets $\leq 1.2$ MHz  Offsets $\geq 1.8$ MHz  Due to switching <sup>c</sup>  ORFS Absolute RF Power Accuracy <sup>d</sup>	          $\pm 0.09$ dB  $\pm 0.11$ dB    	GMSK modulation (GSM) $3\pi/8$ shifted 8PSK modulation, $3\pi/4$ shifted QPSK, $\pi/4$ shifted 16QAM, $-\pi/4$ shifted 32QAM modulation in NSR/HSR (EDGE)  $-20$ dBm (nominal) <sup>a</sup>          $\pm 0.09$ dB (nominal)  $\pm 0.19$ dB (95th percentile)

- For maximum dynamic range, the recommended minimum power is  $-10$  dBm.
- The uncertainty in the RF power ratio reported by ORFS has many components. This specification does not include the effects of added power in the measurements due to dynamic range limitations, but does include the following errors: detection linearity, RF and IF flatness, uncertainty in the bandwidth of the RBW filter, and compression due to high drive levels in the front end.
- The worst-case modeled and computed errors in ORFS due to switching are shown, but there are two further considerations in evaluating the accuracy of the measurement: First, Keysight has been unable to create a signal of known ORFS due to switching, so we have been unable to verify the accuracy of our models. This performance value is therefore shown as nominal instead of guaranteed. Second, the standards for ORFS allow the use of any RBW of at least 300 kHz for the reference measurement against which the ORFS due to switching is ratioed. Changing the RBW can make the measured ratio change by up to about 0.24 dB, making the standards ambiguous to this level. The user may choose the RBW for the reference; the default 300 kHz RBW has good dynamic range and speed, and agrees with past practices. Using wider RBWs would allow for results that depend less on the RBW, and give larger ratios of the reference to the ORFS due to switching by up to about 0.24 dB.
- The absolute power accuracy depends on the setting of the input attenuator as well as the signal-to-noise ratio. For high input levels, the use of the electronic attenuator and "Adjust Atten for Min Clip" will result in high signal-to-noise ratios and Electronic Input Atten  $> 2$  dB, for which the absolute power accuracy is best. At moderate levels, manually setting the Input Atten can give better accuracy than the automatic setting. For GSM and EDGE, "high levels" would nominally be levels above  $+1.7$  dBm and  $-1.3$  dBm, respectively.

1.2 MHz		83.4 dB	81.8 dB			
1.8 MHz		91.9 dB	91.7 dB			

## GSM/EDGE Measurement Application Measurements

- a. Maximum dynamic range requires RF input power above  $-2$  dBm for offsets of 1.2 MHz and below for GSM, and above  $-5$  dBm for EDGE. For offsets of 1.8 MHz and above, the required RF input power for maximum dynamic range is  $+8$  dBm for GSM signals and  $+5$  dBm for EDGE signals.
- b. ORFS standards call for the use of a 5-pole, sync-tuned filter; this and the following footnotes review the instrument's conformance to that standard. Offset frequencies can be measured by using either the FFT method or the direct time method. By default, the FFT method is used for offsets of 400 kHz and below, and the direct time method is used for offsets above 400 kHz. The FFT method is faster, but has lower dynamic range than the direct time method.
- c. The direct time method uses digital Gaussian RBW filters whose noise bandwidth (the measure of importance to "spectrum due to modulation") is within  $\pm 0.5\%$  of the noise bandwidth of an ideal 5-pole sync-tuned filter. However, the Gaussian filters do not match the 5-pole standard behavior at offsets of 400 kHz and below, because they have *lower* leakage of the carrier into the filter. The lower leakage of the Gaussian filters provides a superior measurement because the leakage of the carrier masks the ORFS due to the UUT, so that less masking lets the test be more sensitive to variations in the UUT spectral splatter. But this superior measurement gives a result that does not conform with ORFS standards. Therefore, the default method for offsets of 400 kHz and below is the FFT method.
- d. The FFT method uses an exact 5-pole sync-tuned RBW filter, implemented in software.
- e. EDGE (others) means NSR 16/32QAM and HSR all formats (QPSK/16QAM/32QAM).
- f. The dynamic range for offsets at and below 400 kHz is not directly observable because the signal spectrum obscures the result. These dynamic range specifications are computed from phase noise observations.
- g. Offsets of 1.8 MHz and higher use 100 kHz analysis bandwidths.
- h. The impulse bandwidth (the measure of importance to "spectrum due to switching transients") of the filter used in the direct time method is 0.8% less than the impulse bandwidth of an ideal 5-pole sync-tuned filter, with a tolerance of  $\pm 0.5\%$ . Unlike the case with spectrum due to modulation, the shape of the filter response (Gaussian vs. sync-tuned) does not affect the results due to carrier leakage, so the only parameter of the filter that matters to the results is the impulse bandwidth. There is a mean error of  $-0.07$  dB due to the impulse bandwidth of the filter, which is compensated in the measurement of ORFS due to switching. By comparison, an analog RBW filter with a  $\pm 10\%$  width tolerance would cause a maximum amplitude uncertainty of 0.9 dB.

## Frequency Ranges

Description	Uplink	Downlink
<b>In-Band Frequency Ranges</b>		
P-GSM 900	890 to 915 MHz	935 to 960 MHz
E-GSM 900	880 to 915 MHz	925 to 960 MHz
R-GSM 900	876 to 915 MHz	921 to 960 MHz
DCS1800	1710 to 1785 MHz	1805 to 1880 MHz
PCS1900	1850 to 1910 MHz	1930 to 1990 MHz
GSM850	824 to 849 MHz	869 to 894 MHz
GSM450	450.4 to 457.6 MHz	460.4 to 467.6 MHz
GSM480	478.8 to 486 MHz	488.8 to 496 MHz
GSM700	777 to 792 MHz	747 to 762 MHz
T-GSM810	806 to 821 MHz	851 to 866 MHz

## 33 iDEN/WiDEN/MotoTalk Measurement Application

This chapter contains specifications for the N6149A, iDEN/WiDEN/MotoTalk Measurement Application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

## Frequency and Time

Description	Specifications	Supplemental Information
Frequency and Time-related Specifications		Please refer to <b>“Frequency and Time”</b> on page 20

## Amplitude Accuracy and Range

Description	Specifications	Supplemental Information
Amplitude and Range-related Specifications		Please refer to <b>“Amplitude Accuracy and Range”</b> on page 33.

## Dynamic Range

Description	Specifications	Supplemental Information
Dynamic Range-related Specifications		Please refer to <b>“Dynamic Range”</b> on page 47.

## Application Specifications

Description	Specifications	Supplemental Information
<b>Measurements</b>		
iDEN Power	ACP (adjacent channel power) Occupied Bandwidth	Includes Carrier Power on summary data screen
iDEN Demod	PvT (power versus time) Modulation analysis BER (bit error rate) SER Sub-channel analysis Slot power results	
MotoTalk Demod	EVM (error vector magnitude) Slot power results	
Vector Analysis	IQ waveform BER (bit error rate)	

Description	Specifications	Supplemental Information
<b>Parameter Setups</b>		
Radio Device		BS (outbound) and MS (inbound)  iDEN version R02.00.06 and Motorola TalkAround: RF Interface, TalkAround Protocol (8/19/2002) developed by Motorola Inc.
Radio Standard		
Band widths	25/50/75/100/50-Outer kHz	
Modulation	4QAM/16QAM/64QAM	

Description	Specifications	Supplemental Information
<b>iDEN Power</b>		
Supported Formats	iDEN single carrier TDMA WiDEN- multiple carrier TDMA	
Pass/Fail Tests	Occupied Bandwidth (OBW) Adjacent Channel Power (ACP)	
Carrier Configuration	25 kHz WiDEN 50 kHz WiDEN 75 kHz WiDEN 100 kHz WiDEN 50 kHz Outer WiDEN	

iDEN/WiDEN/MotoTalk Measurement Application  
Application Specifications

Description	Specifications	Supplemental Information
<b>iDEN Signal Demod</b>		
Supported Formats	iDEN single carrier TDMA WiDEN multiple carrier TDMA	
iDEN Composite EVM Floor <sup>a</sup>		
Carrier Configuration	25 kHz WiDEN 50 kHz WiDEN 75 kHz WiDEN 100 kHz WiDEN 50 kHz Outer WiDEN	
Provided Tests	Bit Error Rate (BER) Error Vector Magnitude (EVM) Power Versus Time (PvT)	

a. The EVM floor is derived for signal power –20 dBm at mixer. The signal is iDEN Inbound Full Reserved.

Description	Specifications	Supplemental Information
<b>MotoTalk Signal Demod</b>		
Supported Slot Formats	Traffic Burst Slot Format	
Composite EVM Floor <sup>a</sup>		
Measurement Parameters	Search Length Normalize	IQ and FSK waveforms
Measurement Parameters (advanced)	Gaussian BT Symbol Rate Burst Search on/off	Bandwidth Time product
Result Displays	Slot Error Vector Time Slot Error Summary Table	

a. The EVM floor is derived for signal power –20 dBm at mixer.

## 34 ISDB-T Measurement Application

This chapter contains specifications for N6155A, ISDB-T measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

The specifications apply to carrier frequencies below 2 GHz.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b> (5.6 MHz Integration BW) Minimum power at RF Input Absolute Power Accuracy <sup>a</sup> (20 to 30°C) Measurement floor	$\pm 0.61$ dB	Input signal must not be bursted -50 dBm (nominal) $\pm 0.19$ dB (95th percentile) -87.2 dBm (typical)

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Channel Power with Shoulder Attenuation View</b> (5.60 MHz Integration BW, ML = -14 dBm, Shoulder Offset <sup>a</sup> = 3.40 MHz) Dynamic Range, relative <sup>b</sup>	92.9 dB	Input signal must not be bursted 98.7 dB (typical)

- a. Shoulder offset is the midpoint of the Shoulder Offset Start and Shoulder Offset Stop settings. The specification applies with the default difference between these two of 200 kHz.
- b. The dynamic range specification is the ratio of the channel power to the power in the offset and region specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. This specification is derived from other analyzer performance limitations such as third-order intermodulation, DANL and phase noise. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Mixer level is defined to be the input power minus the input attenuation.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b> Minimum power at RF Input Histogram Resolution	$0.01$ dB <sup>a</sup>	-50 dBm (nominal)

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of a histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

ISDB-T Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Adjacent Channel Power</b>  Minimum power at RF Input  ACPR Accuracy <sup>a</sup> (5.60 MHz noise bandwidth method = IBW, Offset Freq = 6 MHz)	       $\pm 0.16$ dB	       –36 dBm (nominal)  At ACPR –45 dBc with optimum mixer level <sup>b</sup>

- a. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately  $-37 \text{ dBm} - (\text{ACPR}/3)$ , where the ACPR is given in (negative) decibels.
- b. To meet this specified accuracy when measuring transmitter at –45 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –21 dBm, so the input attenuation must be set as close as possible to the average input power. For example, if the average input power is –3 dBm, set the attenuation to 18 dB. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.

Description	Specifications	Supplemental Information
<b>Spectrum Emission Mask</b>  (5.60 MHz Integration BW RBW = 10.0 kHz)		Limit Type <ul style="list-style-type: none"> <li>– Manual</li> <li>– JEITA (ARIB-B31) according to  <math>P \leq 0.025 \text{ W}</math>;  <math>0.025 \text{ W} &lt; P \leq 0.25 \text{ W}</math>;  <math>0.25 \text{ W} &lt; P \leq 2.5 \text{ W}</math>;  <math>P &gt; 2.5 \text{ W}</math>  (P is the channel power)</li> <li>– ABNT Non-Critical</li> <li>– ABNT Sub-Critical</li> <li>– ABNT Critical</li> <li>– ISDB-TSB</li> </ul>
3.0 MHz Offset		
Dynamic Range, relative <sup>ab</sup>	93.8 dB	99.1 dB (typical)
Sensitivity, absolute <sup>c</sup>	–110.5 dBm	–114.5 dBm (typical)
Accuracy		
Relative <sup>d</sup>	±0.08 dB	
Absolute (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)
4.36 MHz Offset		
Dynamic Range, relative <sup>e</sup>	94.2 dB	99.5 dB (typical)
Sensitivity, absolute	–110.5 dBm	–114.5 dBm (typical)
Accuracy		
Relative	±0.10 dB	
Absolute (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 10.0 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about –14 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 10.0 kHz RBW, at a center frequency of 713.142857 MHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- This dynamic range specification applies for the optimum mixer level, which is about –14 dBm. Mixer level is defined to be the average input power minus the input attenuation.

ISDB-T Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Modulation Analysis Settings</b>		
Radio Standard	ISDB-T or ISDB-TSB	
Segment Number	13 Segments for ISDB-T  1 or 3 Segments for ISDB-TSB	
FFT Size	2K, 4K, or 8K	Auto-Detection or Manual Input
Guard Interval	1/4, 1/8, 1/16 or 1/32	Auto-Detection or Manual Input
Partial Reception	On or Off	Auto-Detection or Manual Input
Layer A	Segment Count =1 (Partial Reception=On) or number maximum to 13 (ISDB-T)  Segment Count =1 (ISDB-TSB)  Modulation Format: QPSK/16QAM/64QAM	Auto-Detection or Manual Input
Layer B	Segment Count = number maximum to 13-LayerA Segments (ISDB-T)  Segment Count = 2 (ISDB-TSB)  Modulation Format: QPSK/16QAM/64QAM	Auto-Detection or Manual Input
Layer C	Segment Count = number maximum to 13-LayerA Segments-LayerB Segments  Modulation Format: QPSK/16QAM/64QAM	Auto-Detection or Manual Input
Spectrum	Normal or Invert	
Clock Rate	8.126984 MHz	Auto or Manual
Demod Symbols	4 to 50	
Out of Band Filtering	On or Off	
Data Equalization	On or Off

## 35 LTE Measurement Application

This chapter contains specifications for the N9080A LTE measurement application and for the N9082A measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

## Supported Air Interface Features

Lock range		±2.5 × subcarrier spacing = 37.5 kHz for default 15 kHz subcarrier spacing (nominal)
Accuracy		±1 Hz + tfa <sup>g</sup> (nominal)
Time Offset <sup>h</sup>		
Absolute frame offset accuracy	±20 ns	
Relative frame offset accuracy		±5 ns (nominal)
MIMO RS timing accuracy		±5 ns (nominal)

a. In these specifications, those values with % units are the specifications, while those with decibel units, in parentheses, are conversions from the percentage units to decibels for reader convenience.

b. The accuracy specification applies when EVM is less than 1% and no boost applies for the reference signal.

## LTE Measurement Application Measurements

- c. Overall EVM and Data EVM using 3GPP standard-defined calculation. Phase Noise Optimization set to Best Close-in (<140 kHz).
- d. Requires Option B25, B40, B85, B1A, or B1X (IF bandwidth above 10 MHz).
- e. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  
$$\text{error} = [\text{sqrt}(\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2)] - \text{EVM}_{\text{UUT}}$$
  
where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent.
- f. Requires Option B25, B40, B85, B1A, or B1X (IF bandwidth above 10 MHz).
- g.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .
- h. The accuracy specification applies when EVM is less than 1% and no boost applies for resource elements

## In-Band Frequency Range

Operating Band, FDD	Uplink	Downlink
1	1920 to 1980 MHz	2110 to 2170 MHz
2	1850 to 1910 MHz	1930 to 1990 MHz
3	1710 to 1785 MHz	1805 to 1880 MHz
4	1710 to 1755 MHz	2110 to 2155 MHz
5	824 to 849 MHz	869 to 894 MHz
6	830 to 840 MHz	875 to 885 MHz
7	2500 to 2570 MHz	2620 to 2690 MHz
8	880 to 915 MHz	925 to 960 MHz
9	1749.9 to 1784.9 MHz	1844.9 to 1879.9 MHz
10	1710 to 1770 MHz	2110 to 2170 MHz
11	1427.9 to 1452.9 MHz	1475.9 to 1500.9 MHz
12	698 to 716 MHz	728 to 746 MHz
13	777 to 787 MHz	746 to 756 MHz

LTE Measurement Application  
In-Band Frequency Range

## 36 LTE/LTE-A Measurement Application

This chapter contains specifications for the N9080B LTE/LTE-Advanced FDD measurement application and for the N9082B LTE/LTE-Advanced TDD measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications apply to the single carrier case only, unless otherwise stated.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

## Supported Air Interface Features

Description	Specifications	Supplemental Information
3GPP Standards Supported	36.211 V10.7.0 (March 2013) 36.212 V10.7.0 (December 2012) 36.213 V10.9.0 (March 2013) 36.214 V10.12.0 (March 2013) 36.141 V11.4.0 (March 2013) 36.521-1 V10.5.0 (March 2013)	
Signal Structure	FDD Frame Structure Type 1 TDD Frame Structure Type 2 Special subframe configurations 0-9	N9080B only N9082B only N9082B only
Signal Direction	Uplink and Downlink UL/DL configurations 0-6	N9082B only
Signal Bandwidth	1.4 MHz (6 RB), 3 MHz (15 RB), 5 MHz (25 RB), 10 MHz (50 RB), 15 MHz (75 RB), 20 MHz (100 RB)	
Modulation Formats and Sequences	BPSK; BPSK with I & Q CDM; QPSK; 16QAM; 64QAM; PRS; CAZAC (Zadoff-Chu)	
Component Carrier	1, 2, 3, 4, or 5	
Physical Channels		
Downlink	PBCH, PCFICH, PHICH, PDCCH, PDSCH, PMCH	
Uplink	PUCCH, PUSCH, PRACH	
Physical Signals		
Downlink	P-SS, S-SS, C-RS, P-PS (positioning), MBSFN-RS, CSI-RS	
Uplink	PUCCH-DMRS, PUSCH-DMRS, S-RS (sounding)	

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b>  Minimum power at RF input  Absolute power accuracy <sup>a</sup> (20 to 30°C, Atten = 10 dB)  95th Percentile Absolute power accuracy (20 to 30°C, Atten = 10 dB)  Measurement floor	   ±0.63 dB   	  –50 dBm (nominal)   ±0.19 dB   –80.7 dBm (nominal) in a 10 MHz bandwidth

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that the measurement floor contribution is negligible.

Description	Specifications	Supplemental Information
<b>Transmit On/Off Power</b>  Burst Type Transmit power Dynamic Range <sup>a</sup> Average type Measurement time Trigger source		This table applies only to the N9082B measurement application.  Traffic, DwPTS, UpPTS, SRS, PRACH  Min, Max, Mean, Off  124.5 dB (nominal)  Off, RMS, Log  Up to 20 slots  External 1, External 2, Periodic, RF Burst, IF Envelope

- a. This dynamic range expression is for the case of Information BW = 5 MHz; for other Info BW, the dynamic range can be derived. The equation is:  
Dynamic Range = Dynamic Range for 5 MHz – 10\*log10(Info BW/5.0e6)

Description		Specifications			Supplemental Information	
Adjacent Channel Power					Single Carrier	
Minimum power at RF input					−36 dBm (nominal)	
Accuracy						
Radio	Offset	5 MHz	10 MHz	20 MHz	ACPR Range for Specification	
MS	Adjacent <sup>a</sup>	±0.08 dB	±0.09 dB	±0.13 dB	−33 to −27 dBc with opt ML <sup>b</sup>	
BTS	Adjacent <sup>c</sup>	±0.29 dB	±0.38 dB	±0.54 dB	−48 to −42 dBc with opt ML <sup>d</sup>	
BTS	Alternate <sup>c</sup>	±0.09 dB	±0.12 dB	±0.18 dB	−48 to −42 dBc with opt ML <sup>e</sup>	
Dynamic Range E-UTRA					Test conditions <sup>f</sup>	
Offset	Channel BW				Dynamic Range (nominal)	Optimum Mixer Level (nominal)
Adjacent	5 MHz				83.5 dB	−8.5 dBm
Adjacent	10 MHz				82.1 dB	−8.3 dBm
Alternate	5 MHz				86.7 dB	−8.5 dBm
Alternate	10 MHz				83.7 dB	−8.3 dBm
Dynamic Range UTRA					Test conditions <sup>f</sup>	
Offset	Channel BW				Dynamic Range (nominal)	Optimum Mixer Level (nominal)
2.5 MHz	5 MHz				86.2 dB	−8.5 dBm
2.5 MHz	10 MHz				84.2 dB	−8.3 dBm
7.5 MHz	5 MHz				87.3 dB	−8.7 dBm
7.5 MHz	10 MHz				87.0 dB	−8.4 dBm

- Measurement bandwidths for mobile stations are 4.5, 9.0 and 18.0 MHz for channel bandwidths of 5, 10 and 20 MHz respectively.
- The optimum mixer levels (ML) are –25, –22 and –21 dBm for channel bandwidths of 5, 10 and 20 MHz respectively.
- Measurement bandwidths for base transceiver stations are 4.515, 9.015 and 18.015 MHz for channel bandwidths of 5, 10 and 20 MHz respectively.
- The optimum mixer levels (ML) are –19, –17 and –16 dBm for channel bandwidths of 5, 10 and 20 MHz respectively.
- The optimum mixer level (ML) is –8 dBm.
- E-TM1.1 and E-TM1.2 used for test. Noise Correction set to On.

LTE/LTE-A Measurement Application  
Measurements

Description	Specification	Supplemental Information
<b>Occupied Band width</b>  Minimum carrier power at RF Input  Frequency accuracy	   $\pm 10$ kHz	  –30 dBm (nominal)  RBW = 30 kHz, Number of Points = 1001, Span = 10 MHz

Description	Specifications	Supplemental Information
<b>Spectrum Emission Mask</b>     Dynamic Range Channel Bandwidth 5 MHz 10 MHz 20 MHz Sensitivity Accuracy Relative Absolute, 20 to 30°C	     81.4 dB 85.2 dB 83.4 dB –96.5 dBm  $\pm 0.11$ dB $\pm 0.62$ dB	Offset from CF = (channel bandwidth + measurement bandwidth) / 2; measurement bandwidth = 100 kHz      86.0 dB (typical) 89.8 dB (typical) 89.0 dB (typical) –100.5 dBm (typical)   $\pm 0.21$ dB (95th percentile)

LTE/LTE-A Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Spurious Emissions</b>		Table-driven spurious signals; search across regions
Dynamic Range <sup>a</sup> , relative (RBW = 1 MHz)	87.4 dB	91.1 dB (typical)
Sensitivity <sup>b</sup> , absolute (RBW=1 MHz)	−86.5 dBm	−90.5 dBm (typical)
Accuracy		
Attenuation = 10 dB		
Frequency Range		
20 Hz to 3.6 GHz		±0.19 dB (95th percentile)
3.5 to 8.4 GHz		±1.09 dB (95th percentile)
8.3 to 13.6 GHz		±1.48 dB (95th percentile)

- The dynamic range is specified at 12.5 MHz offset from center frequency with mixer level of 1 dB compression point, which will degrade accuracy by 1 dB.
- The sensitivity is specified at far offset from carrier, where phase noise does not contribute. You can derive the dynamic range at far offset from 1 dB compression mixer level and sensitivity.

LTE/LTE-A Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Modulation Analysis</b>		% and dB expressions <sup>a</sup>
(Signal level within one range step of overload)		
OSTP/RSTP		
Absolute accuracy <sup>b</sup>		±0.21 dB (nominal)
EVM for Downlink (OFDMA) Floor <sup>c</sup>

Absolute frame offset accuracy	±20 ns	
Relative frame offset accuracy		±5 ns (nominal)
MIMO RS timing accuracy		±5 ns (nominal)

- a. In these specifications, those values with % units are the specifications, while those with decibel units, in parentheses, are conversions from the percentage units to decibels for reader convenience.
- b. The accuracy specification applies when EVM is less than 1% and no boost applies for the reference signal.
- c. Overall EVM and Data EVM using 3GPP standard-defined calculation. Phase Noise Optimization set to Best Close-in (<140 kHz).
- d. Requires Option B25, B40, B85, B1A, or B1X (IF bandwidth above 10 MHz).

## LTE/LTE-A Measurement Application Measurements

- e. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  
$$\text{error} = [\text{sqrt}(\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2)] - \text{EVM}_{\text{UUT}}$$
where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent.
- f.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .
- g. The accuracy specification applies when EVM is less than 1% and no boost applies for resource elements

## In-Band Frequency Range

Operating Band, FDD	Uplink	Downlink
1	1920 to 1980 MHz	2110 to 2170 MHz
2	1850 to 1910 MHz	1930 to 1990 MHz

LTE/LTE-A Measurement Application  
In-Band Frequency Range

- a. ACP measurements and SEM for operating Band 22 and 42 require measurement of some spectral energy above the 3.6 GHz maximum for Band 0 in earlier firmware versions. These measurements can be made with the combination of recent firmware, version A.16.13 or later, and calibration of the analyzer in analyzer RF Band 0 extended to 3.7 GHz instead of the 3.6 GHz supported by earlier versions of the firmware. The calibration extension occurs in production of instruments with Frequency Option 508, 513 or 526 and serial number is equal with or greater than the following: US54490126, MY54490690, or SG54490127; older analyzers with these frequency options and recent firmware can be have their Band 0 coverage extended in service centers upon request.

With the combination of recent firmware and extended Band 0 range, the performance in the region above 3.6 GHz is nominally similar to that just below 3.6 GHz but not warranted.

Operating Band, TDD	Uplink/Downlink
33	1900 to 1920 MHz
34	2010 to 2025 MHz
35	1850 to 1910 MHz
36	1930 to 1990 MHz
37	1910 to 1930 MHz
38	2570 to 2620 MHz
39	1880 to 1920 MHz
40	2300 to 2400 MHz
41	2496 to 2690 MHz
42 See note <sup>a</sup>	3400 to 3600 MHz
44	703 to 803 MHz

- a. ACP measurements and SEM for operating Band 22 and 42 require measurement of some spectral energy above the 3.6 GHz maximum for Band 0 in earlier firmware versions. These measurements can be made with the combination of recent firmware, version A.16.13 or later, and calibration of the analyzer in analyzer RF Band 0 extended to 3.7 GHz instead of the 3.6 GHz supported by earlier versions of the firmware. The calibration extension occurs in production of instruments with Frequency Option 508, 513 or 526 and serial number is equal with or greater than the following: US54490126, MY54490690, or SG54490127; older analyzers with these frequency options and recent firmware can be have their Band 0 coverage extended in service centers upon request.

With the combination of recent firmware and extended Band 0 range, the performance in the region above 3.6 GHz is nominally similar to that just below 3.6 GHz but not warranted.

## 37 Multi-Standard Radio Measurement Application

This chapter contains specifications for the N9083A Multi-Standard Radio (MSR) measurement application. The measurements for GSM/EDGE, W-CDMA and LTE FDD also require N9071A-2FP, N9073A-1FP, and N9080A-1FP respectively.

### **Additional Definitions and Requirements**

The specifications apply in the frequency range documented in In-Band Frequency Range of each application.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b>  Minimum power at RF Input  95th percentile Absolute power accuracy (20 to 30°C, Atten = 10 dB)		–50 dBm (nominal)  ±0.19 dB

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b>  Histogram Resolution	0.01 dB <sup>a</sup>	

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of the histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Description	Specifications	Supplemental Information
<b>Occupied Band width</b>  Minimum power at RF Input  Frequency Accuracy		–30 dBm (nominal)  ± (Span / 1000) (nominal)

Description	Specifications	Supplemental Information
<b>Spurious Emissions</b>  Accuracy (Attenuation = 10 dB)  Frequency Range 20 Hz to 3.6 GHz 3.5 to 8.4 GHz 8.3 to 13.6 GHz		Table-driven spurious signals; search across regions     ±0.19 dB (95th percentile) ±1.08 dB (95th percentile) ±1.48 dB (95th percentile)

Multi-Standard Radio Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Conformance EVM<sup>a</sup></b>		
<b>GSM/EDGE<sup>b</sup></b>		
EVM, rms - floor (EDGE)		0.6% (nominal)
Phase error, rms - floor (GSM)		0.5° (nominal)
<b>W-CDMA<sup>c</sup></b>		
Composite EVM floor		1.5% (nominal)
<b>LTE FDD<sup>d</sup></b>		
EVM floor for downlink (OFDMA)		% and dB expression <sup>e</sup>
Signal bandwidths		
5 MHz		0.44% (-47.1 dB) (nominal)
10 MHz		0.36% (-48.8 dB) (nominal)
20 MHz		0.38% (-48.4 dB) (nominal)

- The signal level is within one range step of overload. The specification for floor do not include signal-to-noise impact which may decrease by increasing the number of carriers. The noise floor can be estimated by  $DANL + 2.51 + 10 \times \log_{10}(MeasBW)$ , where DANL is the Display Averaged Noise Level specification in dBm and MeasBW is the measurement bandwidth at the receiver in Hz.
- Specifications apply when the carrier spacing is 600 kHz and the carrier power of each adjacent channel does not exceed the carrier power of the channel tested for EVM.
- Specifications apply when the carrier spacing is 5 MHz and the carrier power of each adjacent channel does not exceed the carrier power of the channel tested for EVM.
- Specifications apply when the carrier spacing is the same as the signal bandwidth and the carrier power of each adjacent channel does not exceed the carrier power of the channel tested for EVM.
- In LTE FDD specifications, those values with % units are the specifications, while those with decibel units, in parentheses, are conversion from the percentage units to decibels for reader convenience.

## In-Band Frequency Range

Refer to the tables of In-Band Frequency Range in GSM/EDGE on [page 340](#), W-CDMA on [page 405](#), and LTE on [page 365](#).

## 38 TD-SCDMA Measurement Application

This chapter contains specifications for two measurement applications. One of those is the N9079A-1FP or N9079A-1TP TD-SCDMA measurement application. Modulation specifications rows and columns labeled with DPCH apply to TD-SCDMA only. The other application is the N9079A-2FP or N9079A-2TP HSPA/8PSK measurement application. Modulation specifications rows and columns labeled with HS-PDSCH apply to HSPA/8PSK only.

### Additional Definitions and Requirements

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

## Measurements

Description	Specification	Supplemental Information
<b>Power vs. Time</b>		
Burst Type		Traffic, UpPTS and DwPTS
Measurement results type		Min, Max, Mean
Dynamic range		130.4 dB (nominal)
Averaging type		Off, RMS, Log
Measurement time		Up to 9 slots
Trigger type		External1, External2, RF Burst
Measurement floor		-100.4 dBm (nominal)

Description	Specification	Supplemental Information
<b>Transmit Power</b>		
Burst Type		Traffic, UpPTS, and DwPTS
Measurement results type		Min, Max, Mean
Averaging type		Off, RMS, Log
Average mode		Exponential, Repeat
Measurement time		Up to 18 slots
Power Accuracy		$\pm 0.20$ dB(95th percentile)
Measurement floor		-90.4 dBm(nominal)

Description		Specification	Supplemental Information	
<b>Adjacent Channel Power</b>				
<b>Single Carrier</b>				
Minimum Power at RF Input			–36 dBm (nominal)	
ACPR Accuracy <sup>a</sup>			RRC weighted, 1.28 MHz noise bandwidth, method = IBW	
<b>Radio</b>	<b>Offset Freq</b>			
MS (UE)	1.6 MHz	±0.04 dB	At ACPR range of –30 to –36 dBc with optimum mixer level <sup>b</sup>	
MS (UE)	3.2 MHz	±0.09 dB	At ACPR range of –40 to –46 dBc with optimum mixer level <sup>c</sup>	
BTS	1.6 MHz	±0.07 dB	At ACPR range of –37 to –43 dBc with optimum mixer level <sup>d</sup>	
BTS	3.2 MHz	±0.11 dB	At ACPR range of –42 to –48 dBc with optimum mixer level <sup>e</sup>	
BTS	1.6 MHz	±0.04 dB	At –43 dBc non-coherent ACPR <sup>d</sup>	
<b>Multiple Carriers</b>			RRC weighted, 1.28 MHz noise bandwidth. All specifications apply for 1.6 MHz offset.	
Four Carriers				
ACPR Accuracy, BTS, Incoherent TOI <sup>cf</sup>			<b>UUT ACPR</b>	<b>Optimum ML<sup>g</sup></b>
Noise Correction (NC) off		±0.08 dB	–37 to –43 dB	–14 dBm
Noise Correction (NC) on		±0.06 dB	–37 to –43 dB	–18 dBm

- a. The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately –37 dBm – (ACPR/3), where the ACPR is given in (negative) decibels.
- b. To meet this specified accuracy when measuring mobile station (MS) or user equipment (UE) within 3 dB of the required –33 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –25 dBm, so the input attenuation must be set as close as possible to the average input power – (–25 dBm). For example, if the average input power is –6 dBm, set the attenuation to 19 dB. This specification applies for the normal 3.5 dB peak-to-average ratio of a single code. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- c. ACPR accuracy at 3.2 MHz offset is warranted when the input attenuator is set to give an average mixer level of –13 dBm.

## TD-SCDMA Measurement Application Measurements

- d. In order to meet this specified accuracy, the mixer level must be optimized for accuracy when measuring node B Base Transmission Station (BTS) within 3 dB of the required -40 dBc ACPR. This optimum mixer level is -23 dBm, so the input attenuation must be set as close as possible to the average input power - (-23 dBm). For example, if the average input power is -5 dBm, set the attenuation to 18 dB. This specification applies for the normal 10 dB peak-to-average ratio (at 0.01% probability) for Test Model 1. Note that, if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- e. ACPR accuracy at 3.2 MHz offset is warranted when the input attenuator is set to give an average mixer level of -12 dBm.
- f. Incoherent TOI means that the specified accuracy only applies when the distortions of the device under test are not coherent with the third-order distortion of the analyzer. Incoherence is often the case with advanced multi-carrier amplifiers built with compensations and predistortions that mostly eliminate coherent third-order affects in the amplifier.
- g. Optimum mixer level (MLOpt). The mixer level is given by the average power of the sum of the four carriers minus the input attenuation.

Description	Specification	Supplemental Information
<b>Power Statistics CCDF</b>		
Histogram Resolution	0.01 dB <sup>a</sup>	

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of the histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Description	Specification	Supplemental Information
<b>Occupied Band width</b>		
Minimum power at RF Input		-30 dBm (nominal)
Frequency Accuracy	±4.8 kHz	RBW = 30 kHz, Number of Points = 1001, Span = 4.8 MHz

TD-SCDMA Measurement Application  
Measurements

Description	Specification	Supplemental Information
<b>Spectrum Emission Mask</b>		
Dynamic Range, relative (815 kHz offset <sup>ab</sup> )	86.0 dB	90.5 dB (typical)
Sensitivity, absolute (815 kHz offset <sup>c</sup> )	−103.7 dBm	−106.7 dBm (typical)
Accuracy (815 kHz offset)		
Relative <sup>d</sup>	±0.06 dB	
Absolute <sup>e</sup> , 20 to 30°C	±0.62 dB	±0.21 dB (95th percentile)

- a. The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 30 kHz RBW.
- b. This dynamic range specification applies for the optimum mixer level, which is about −17 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- c. The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 30 kHz RBW, at a center frequency of 2 GHz.
- d. The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- e. The absolute accuracy of SEM measurement is the same as the absolute accuracy of the spectrum analyzer.

TD-SCDMA Measurement Application  
Measurements

Description	Specification	Supplemental Information
<b>Spurious Emissions</b>		
Dynamic Range <sup>a</sup> , relative (RBW=1 MHz)	88.8 dB	91.8 dB (typical)
Sensitivity <sup>b</sup> , absolute (RBW=1 MHz)	−88.5 dBm	−91.5 dBm (typical)
Accuracy (Attenuation = 10 dB)		
Frequency Range		
20 Hz to 3.6 GHz		±0.19 dB (95th percentile)
3.5 to 8.4 GHz		±1.08 dB (95th percentile)
8.3 to 13.6 GHz		±1.48 dB (95th percentile)

- The dynamic range is specified at 12.5 MHz offset from center frequency with mixer level of 1 dB compression point, which will degrade accuracy by 1 dB.
- The sensitivity is specified at far offset from carrier, where phase noise does not contribute. You can derive the dynamic range at far offset from 1 dB compression mixer level and sensitivity.

## TD-SCDMA Measurement Application

[illegible]

- a. ML (mixer level) is RF input power minus attenuation.
- b. Code Domain Power Absolute accuracy is calculated as sum of 95th percentile Absolute Amplitude Accuracy and Code Domain relative accuracy at Code Power Level.
- c. This is tested for signal with 2 DPCH or 2 HS-PDSCH in TS0.

## TD-SCDMA Measurement Application

### Measurements

TD-SCDMA Measurement Application  
Measurements

Description	Specification	Supplemental Information
Test signal with TS0 active and one HS-PDSCH in TS0		$\pm 6 \text{ Hz} + \text{tfaf}$ (nominal)

- a. ML (mixer level) is RF input power minus attenuation.
- b. The EVM floor is derived for signal power  $-20 \text{ dBm}$ . The signal has only 1 DPCH or HS-PDSCH in TS0.
- c. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  $\text{error} = [\sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2}] - \text{EVM}_{\text{UUT}}$ , where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 7%, and the floor is 2.5%, the error due to the floor is 0.43%.
- d. The accuracy is derived in the EVM range 0 to 18%. We choose the maximum EVM variance in the results as the accuracy.
- e. This specifies a synchronization range with Midamble.
- f.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$ .

## In-Band Frequency Range

Operating Band	Frequencies
I	1900 to 1920 MHz 2010 to 2025 MHz
II	1850 to 1910 MHz 1930 to 1990 MHz
III	1910 to 1930 MHz

## 39 W-CDMA Measurement Application

This chapter contains specifications for the N9073A W-CDMA/HSPA/HSPA+ measurement application. It contains N9073A-1FP W-CDMA, N9073A-2FP HSPA and N9073A-3FP HSPA+ measurement applications.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove those variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

The specifications for this chapter apply only to instruments with Frequency *Option 503, 508, 513 or 526*. For Instruments with higher frequency options, the performance is nominal only and not subject to any warranted specifications.

The measurement performance is only slightly different between instruments with the lower and higher frequency options. Because the hardware performance of the analyzers is very similar but not identical, you can estimate the nominal performance of the measurements from the specifications in this chapter.

## Conformance with 3GPP TS 25.141 Base Station Requirements

3GPP Standard Sections Sub-Clause	Measurement Name	3GPP Required Test Instrument Tolerance (as of 2009-12)	Instrument Tolerance Interval <sup>abc</sup>	Supplemental Information
6.2.1	Maximum Output Power (Channel Power)	±0.7 dB (95%)	±0.19 dB (95%)	Excluding timebase error
6.2.2	CPICH Power Accuracy (Code Domain)	±0.8 dB (95%)	±0.25 dB (95%)	
6.3	Frequency Error (Modulation Accuracy)	±12 Hz (95%)	±5 Hz (100%)	
6.4.2	Power Control Steps <sup>d</sup> (Code Domain)			
	1 dB step	±0.1 dB (95%)	±0.03 dB (100%)	
	Ten 1 dB steps	±0.1 dB (95%)	±0.03 dB (100%)	
6.4.3	Power Dynamic Range	±1.1 dB (95%)	±0.14 dB (100%)	
6.4.4	Total Power Dynamic Range <sup>d</sup> (Code Domain)	±0.3 dB (95%)	±0.06 dB (100%)	Absolute peak <sup>e</sup>
6.5.1	Occupied Bandwidth	±100 kHz (95%)	±10 kHz (100%)	
6.5.2.1	Spectrum Emission Mask	±1.5 dB (95%)	±0.20 dB (95%)	
6.5.2.2	ACLR			
	5 MHz offset	±0.8 dB (95%)	±0.20 dB (100%)	
	10 MHz offset	±0.8 dB (95%)	±0.18 dB (100%)	
6.5.3	Spurious Emissions			
	f ≤ 2.2 GHz	±1.5 dB (95%)	±0.19 dB (95%)	EVM in the range of 12.5% to 22.5%
	2.2 GHz < f ≤ 4 GHz	±2.0 dB (95%)	±1.09 dB (95%)	
	4 GHz < f	±4.0 dB (95%)	±1.48 dB (95%)	
6.7.1	EVM (Modulation Accuracy)	±2.5% (95%)	±0.5% (100%)	
6.7.2	Peak Code Domain Error (Modulation accuracy)	±1.0 dB (95%)	±1.0 dB (100%)	
6.7.3	Time alignment error in Tx Diversity (Modulation Accuracy)	±26 ns (95%) [= 0.1 T <sub>c</sub> ]	±1.25 ns (100%)	

- a. Those tolerances marked as 95% are derived from 95th percentile observations with 95% confidence.  
b. Those tolerances marked as 100% are derived from 100% limit tested observations. Only the 100% limit tested observations are covered by the product warranty.

W-CDMA Measurement Application  
Conformance with 3GPP TS 25.141 Base Station Requirements

- c. The computation of the instrument tolerance intervals shown includes the uncertainty of the tracing of calibration references to national standards. It is added, in a root-sum-square fashion, to the observed performance of the instrument.
- d. These measurements are obtained by utilizing the code domain power function or general instrument capability. The tolerance limits given represent instrument capabilities.
- e. The tolerance interval shown is for the peak absolute power of a CW-like spurious signal. The standards for SEM measurements are ambiguous as of this writing; the tolerance interval shown is based on Keysight's interpretation of the current standards and is subject to change.

## Measurements

Description	Specifications	Supplemental Information
<b>Channel Power</b>  Minimum power at RF Input  Absolute power accuracy <sup>a</sup> (20 to 30°C, Atten = 10 dB)  95th percentile Absolute power accuracy (20 to 30°C, Atten = 10 dB)  Measurement floor	$\pm 0.61$ dB	–50 dBm (nominal)    $\pm 0.19$ dB   –85.8 dBm (nominal)

- a. Absolute power accuracy includes all error sources for in-band signals except mismatch errors and repeatability due to incomplete averaging. It applies when the mixer level is high enough that measurement floor contribution is negligible.

Description			Specifications	Supplemental Information	
<b>Adjacent Channel Power (ACPR; ACLR)</b>					
Single Carrier

ACPR Accuracy <sup>ab</sup>				RRC weighted, 3.84 MHz noise bandwidth, method = IBW or Fast <sup>c</sup>	
Radio	Offset Freq				
MS (UE)	5 MHz		±0.08 dB	At ACPR range of −30 to −36 dBc with optimum mixer level <sup>d</sup>	
MS (UE)	10 MHz		±0.09 dB	At ACPR range of −40 to −46 dBc with optimum mixer level <sup>e</sup>	
BTS	5 MHz		±0.20 dB	At ACPR range of −42 to −48 dBc with optimum mixer level <sup>f</sup>	
BTS	10 MHz		±0.18 dB	At ACPR range of −47 to −53 dBc with optimum mixer level <sup>e</sup>	
BTS	5 MHz		±0.10 dB	At −48 dBc non-coherent ACPR <sup>g</sup>	
Dynamic Range				RRC weighted, 3.84 MHz noise bandwidth	
Noise Correction <sup>h</sup>	Offset Freq	Method		Typical <sup>i</sup> Dynamic Range	Optimum ML (nominal)
off	5 MHz	Filtered IBW		−81.5 dB	−8 dBm
off	5 MHz	Fast		−81.0 dB	−8 dBm
off	10 MHz	Filtered IBW		−87.0 dB	−4 dBm
on	5 MHz	Filtered IBW		−82.5 dB	−8 dBm
on	5 MHz	Filtered IBW		−88 dB (note <sup>j</sup> )	−8 dBm
on	10 MHz	Filtered IBW		−88.0 dB	−4 dBm
RRC Weighting Accuracy <sup>k</sup>					
White noise in Adjacent Channel				0.00 dB (nominal)	
TOI-induced spectrum				0.001 dB (nominal)	
rms CW error				0.012 dB (nominal)	
Multiple Carriers				RRC weighted, 3.84 MHz noise bandwidth. All specifications apply for 5 MHz offset.	

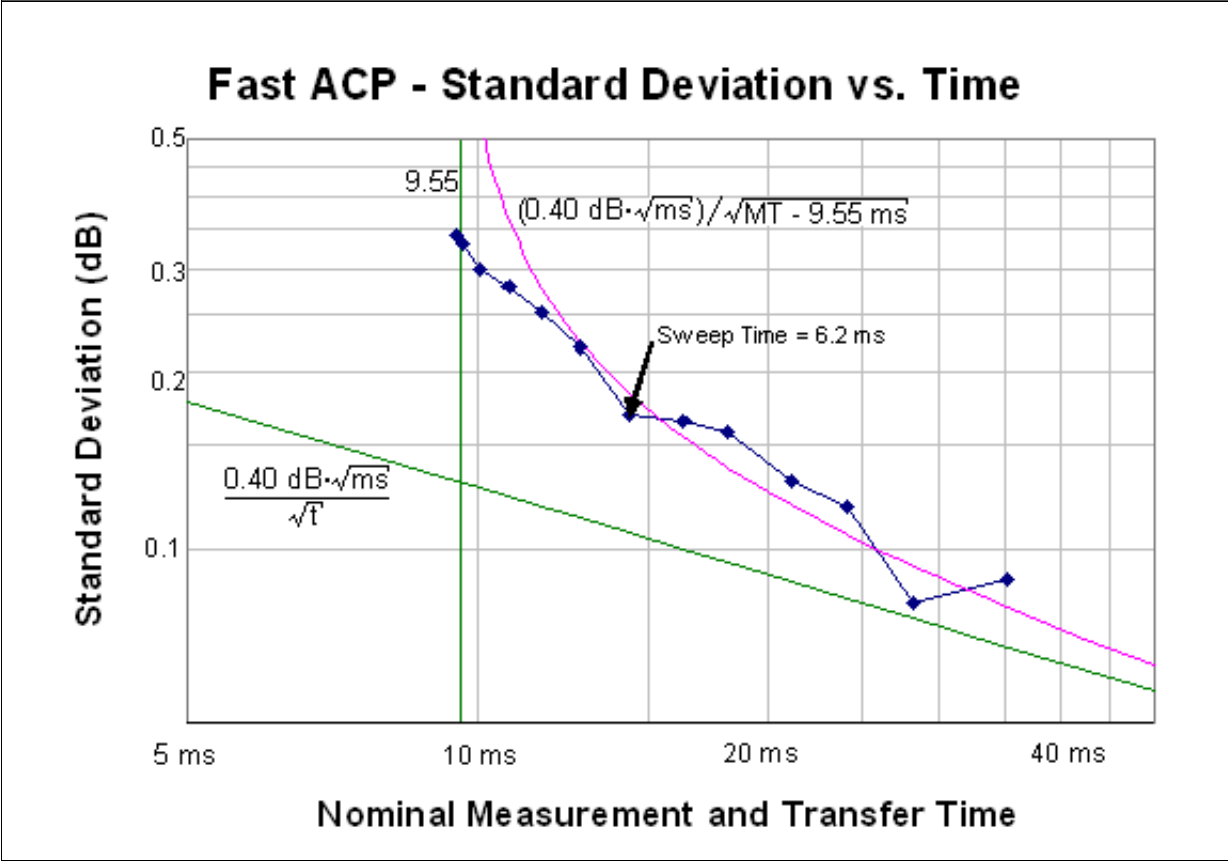

W-CDMA Measurement Application  
Measurements

Description	Specifications	Supplemental Information	
Two Carriers			
ACPR Dynamic Range		–83 dB, NC on (nominal)	
ACPR Accuracy		±0.20 dB (nominal)	
Four Carriers		Dynamic range (nominal)	Optimum ML <sup>l</sup> (nominal)
ACPR Dynamic Range			
Noise Correction (NC) and NFE off		–69 dB	–8 dBm
Noise Correction (NC) on		–79 dB	–12 dBm
ACPR Accuracy, BTS, Incoherent TOI <sup>m</sup>		UUT ACPR Range	
Noise Correction (NC) off <sup>n</sup>	±0.18 dB	–42 to –48 dB	–12 dBm
Noise Correction (NC) on	±0.09 dB	–42 to –48 dB	–15 dBm

- The accuracy of the Adjacent Channel Power Ratio will depend on the mixer drive level and whether the distortion products from the analyzer are coherent with those in the UUT. These specifications apply even in the worst case condition of coherent analyzer and UUT distortion products. For ACPR levels other than those in this specifications table, the optimum mixer drive level for accuracy is approximately –37 dBm – (ACPR/3), where the ACPR is given in (negative) decibels.
- Accuracy is specified without NC or NFE. NC or NFE will make the accuracy even better.
- The Fast method has a slight decrease in accuracy in only one case: for BTS measurements at 5 MHz offset, the accuracy degrades by ±0.01 dB relative to the accuracy shown in this table.
- To meet this specified accuracy when measuring mobile station (MS) or user equipment (UE) within 3 dB of the required –33 dBc ACPR, the mixer level (ML) must be optimized for accuracy. This optimum mixer level is –22 dBm, so the input attenuation must be set as close as possible to the average input power – (–22 dBm). For example, if the average input power is –6 dBm, set the attenuation to 16 dB. This specification applies for the normal 3.5 dB peak-to-average ratio of a single code. Note that if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- ACPR accuracy at 10 MHz offset is warranted when the input attenuator is set to give an average mixer level of –14 dBm
- In order to meet this specified accuracy, the mixer level must be optimized for accuracy when measuring node B Base Transmission Station (BTS) within 3 dB of the required –45 dBc ACPR. This optimum mixer level is so the input attenuation must be set as close as possible to the average input power – (–18 dBm). For example, if the average input power is –4 dBm, set the attenuation to 14 dB. This specification applies for the normal 10 dB peak-to-average ratio (at 0.01% probability) for Test Model 1. Note that, if the mixer level is set to optimize dynamic range instead of accuracy, accuracy errors are nominally doubled.
- Accuracy can be excellent even at low ACPR levels assuming that the user sets the mixer level to optimize the dynamic range, and assuming that the analyzer and UUT distortions are incoherent. When the errors from the UUT and the analyzer are incoherent, optimizing dynamic range is equivalent to minimizing the contribution of analyzer noise and distortion to accuracy, though the higher mixer level increases the display scale fidelity errors. This incoherent addition case is commonly used in the industry and can be useful for comparison of analysis equipment, but this incoherent addition model is rarely justified. This derived accuracy specification is based on a mixer level of –14 dBm.
- The dynamic range shown with Noise Correction = Off applies with Noise Floor Extension On. (Noise Correction is the process within the measurement of making a calibration of the noise floor at the exact analyzer settings used for the measurement. Noise Floor Extension is the factory calibration of the noise floor.)

- i. Keysight measures 100% of the signal analyzers for dynamic range in the factory production process. This measurement requires a near-ideal signal, which is impractical for field and customer use. Because field verification is impractical, Keysight only gives a typical result. More than 80% of prototype instruments met this "typical" specification; the factory test line limit is set commensurate with an on-going 80% yield to this typical. The ACPR dynamic range is verified only at 2 GHz, where Keysight has the near-perfect signal available. The dynamic range is specified for the optimum mixer drive level, which is different in different instruments and different conditions. The test signal is a 1 DPCH signal.  
The ACPR dynamic range is the observed range. This typical specification includes no measurement uncertainty.
- j. All three early production units hand-measured had performance better than 88 dB with a test signal even better than the "near-ideal" one used for statistical process control in production mentioned in the footnote<sup>i</sup> above. Therefore, this value can be considered "Nominal," not "Typical," by the definitions used within this document. These observations were done near 2 GHz, because that is a common W-CDMA operation region. It is also a region in which the analyzer third-order dynamic range is near its best.
- k. 3GPP requires the use of a root-raised-cosine filter in evaluating the ACLR of a device. The accuracy of the pass-band shape of the filter is not specified in standards, nor is any method of evaluating that accuracy. This footnote discusses the performance of the filter in this instrument. The effect of the RRC filter and the effect of the RBW used in the measurement interact. The analyzer compensates the shape of the RRC filter to accommodate the RBW filter. The effectiveness of this compensation is summarized in three ways:
  - White noise in Adj Ch: The compensated RRC filter nominally has no errors if the adjacent channel has a spectrum that is flat across its width.
  - TOI-induced spectrum: If the spectrum is due to third-order intermodulation, it has a distinctive shape. The computed errors of the compensated filter are  $-0.004$  dB for the 470 kHz RBW used for UE testing with the IBW method and also used for all testing with the Fast method, and  $0.000$  dB for the 30 kHz RBW filter used for BTS testing with the IBW method. The worst error for RBWs between these extremes is  $0.05$  dB for a 330 kHz RBW filter.
  - rms CW error: This error is a measure of the error in measuring a CW-like spurious component. It is evaluated by computing the root of the mean of the square of the power error across all frequencies within the adjacent channel. The computed rms error of the compensated filter is  $0.023$  dB for the 470 kHz RBW used for UE testing with the IBW method and also used for all testing with the Fast method, and  $0.000$  dB for the 30 kHz RBW filter used for BTS testing. The worst error for RBWs between these extremes is  $0.057$  dB for a 430 kHz RBW filter.
- l. Optimum mixer level (MLOpt). The mixer level is given by the average power of the sum of the four carriers minus the input attenuation.
- m. Incoherent TOI means that the specified accuracy only applies when the distortions of the device under test are not coherent with the third-order distortion of the analyzer. Incoherence is often the case with advanced multi-carrier amplifiers built with compensations and predistortions that mostly eliminate coherent third-order effects in the amplifier.
- n. Accuracy is specified without NFE. With NFE, the accuracy will be closer to that with NC, and the optimum mixer level will be close to that for NC.

Fast ACPR Test<sup>a</sup>

- a. Observation conditions for ACP speed:  
Display Off, signal is Test Model 1 with 64 DPCH, Method set to Fast. Measured with an IBM compatible PC with a 3 GHz Pentium 4 running Windows XP Professional Version 2002. The communications medium was PCI-GPIB IEEE 488.2. The Test Application Language was .NET - C#. The Application Communication Layer was Keysight T&M Programmer's Toolkit Redistributable Package 2.1, Keysight I/O Libraries 15.1.

Description	Specifications	Supplemental Information
<b>Power Statistics CCDF</b>		
Histogram Resolution	0.01 dB <sup>a</sup>	

- a. The Complementary Cumulative Distribution Function (CCDF) is a reformatting of the histogram of the power envelope. The width of the amplitude bins used by the histogram is the histogram resolution. The resolution of the CCDF will be the same as the width of those bins.

Description	Specifications	Supplemental Information
<b>Occupied Band width</b>		
Minimum power at RF Input		–30 dBm (nominal)
Frequency Accuracy	±10 kHz	RBW = 30 kHz, Number of Points = 1001, span = 10 MHz

Description	Specifications	Supplemental Information
<b>Spectrum Emission Mask</b>		
Dynamic Range, relative (2.515 MHz offset <sup>ab</sup> )	87.9 dB	92.6 dB (typical)
Sensitivity, absolute (2.515 MHz offset <sup>c</sup> )	–103.7 dBm	–106.7 dBm (typical)
Accuracy (2.515 MHz offset)		
Relative <sup>d</sup>	±0.08 dB	
Absolute <sup>e</sup> (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 30 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about –16 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 30 kHz RBW, at a center frequency of 2 GHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.
- The absolute accuracy of SEM measurement is the same as the absolute accuracy of the spectrum analyzer. See **“Absolute Amplitude Accuracy” on page 39** for more information. The numbers shown are for 0 to 3.6 GHz, with attenuation set to 10 dB.

W-CDMA Measurement Application  
Measurements

Description	Specifications	Supplemental Information
<b>Spurious Emissions</b>		Table-driven spurious signals; search across regions
Dynamic Range <sup>a</sup> , relative (RBW=1 MHz)	88.8 dB	91.8 dB (typical)
Sensitivity <sup>b</sup> , absolute (RBW=1 MHz)	−88.5 dBm	−91.5 dBm (typical)
Accuracy (Attenuation = 10 dB)		
Frequency Range		
20 Hz to 3.6 GHz		±0.19 dB (95th percentile)
3.5 to 8.4 GHz		±1.09 dB (95th percentile)
8.3 to 13.6 GHz		±1.48 dB (95th percentile)

- The dynamic range is specified at 12.5 MHz offset from center frequency with mixer level of 1 dB compression point, which will degrade accuracy by 1 dB.
- The sensitivity is specified at far offset from carrier, where phase noise does not contribute. You can derive the dynamic range at far offset from 1 dB compression mixer level and sensitivity.

## W-CDMA Measurement Application

[illegible]

- a. ML (mixer level) is RF input power minus attenuation.
- b. Code Domain Power Absolute accuracy is calculated as sum of 95% Confidence Absolute Amplitude Accuracy and Code Domain relative accuracy at Code Power level.

Description	Specifications	Supplemental Information
<b>QPSK EVM</b>

Analyzer Noise Floor		-50 dBc (nominal)
Frequency error		
Range		$\pm 30 \text{ kHz}$ (nominal) <sup>c</sup>
Accuracy	$\pm 5 \text{ Hz} + \text{tfa}^{\text{d}}$	

- a. ML (mixer level) is RF input power minus attenuation.
- b. The accuracy specification applies when the EVM to be measured is well above the measurement floor and successfully synchronized to the signal. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  $\text{error} = \sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2} - \text{EVM}_{\text{UUT}}$ , where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent.
- c. This specifies a synchronization range with CPICH for CPICH only signal.
- d.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$

[illegible]

- a. ML (mixer level) is RF input power minus attenuation.
- b. For 16 QAM or 64 QAM modulation, the relative code domain error (RCDE) must be better than  $-16$  dB and  $-22$  dB respectively.

W-CDMA Measurement Application  
Measurements

- c. The accuracy specification applies when the EVM to be measured is well above the measurement floor. When the EVM does not greatly exceed the floor, the errors due to the floor add to the accuracy errors. The errors due to the floor are noise-like and add incoherently with the UUT EVM. The errors depend on the EVM of the UUT and the floor as follows:  $\text{error} = [\sqrt{\text{EVM}_{\text{UUT}}^2 + \text{EVM}_{\text{sa}}^2}] - \text{EVM}_{\text{UUT}}$ , where  $\text{EVM}_{\text{UUT}}$  is the EVM of the UUT in percent, and  $\text{EVM}_{\text{sa}}$  is the EVM floor of the analyzer in percent. For example, if the EVM of the UUT is 7%, and the floor is 2.5%, the error due to the floor is 0.43%.
- d. This specifies a synchronization range with CPICH for CPICH only signal.
- e.  $\text{tfa} = \text{transmitter frequency} \times \text{frequency reference accuracy}$
- f. The accuracy specification applies when the measured signal is the combination of CPICH (antenna–1) and CPICH (antenna–2), and where the power level of each CPICH is –3 dB relative to the total power of the combined signal. Further, the range of the measurement for the accuracy specification to apply is  $\pm 0.1$  chips.

W-CDMA Measurement Application  
In-Band Frequency Range

## 40 WLAN Measurement Application

This chapter contains specifications for the *N9077A* WLAN measurement application.

### **Additional Definitions and Requirements**

Because digital communications signals are noise-like, all measurements will have variations. The specifications apply only with adequate averaging to remove the variations.

The specifications apply in the frequency range documented in In-Band Frequency Range.

Different IEEE radio standard requires relative minimum hardware bandwidth for OFDM analysis:

802.11a/b/g/p, or 11n (20 MHz), or 11ac (20 MHz) requires N9030A-B25 or above.

802.11n (40 MHz), or 11ac (40 MHz) requires N9030A-B40 or above.

802.11ac (80 MHz) requires N9030A-B85 or above.

802.11ac (160 MHz) requires N9030A-B1X.

802 11ah 1M/2M/4M/8M/16M requires N9030A-B25 or above.

.

<b>Spectrum Emission Mask</b> (18 MHz Transmission BW RBW = 100 kHz 11.0 MHz offset)		Radio standards are: 802.11a/g/j/p (OFDM) 802.11g (DSSS-OFDM) or 802.11n (20 MHz) Center Frequency in 2.4 GHz Band
Dynamic Range, relative <sup>ab</sup>	84.0 dB	87.3 dB (typical)
Sensitivity, absolute <sup>c</sup>	-98.5 dBm	-101.5 dBm (typical)
Accuracy		
Relative <sup>d</sup>	±0.11 dB	
Absolute (20 to 30°C)	±0.62 dB	±0.21 dB (95th percentile)

- The dynamic range specification is the ratio of the channel power to the power in the offset specified. The dynamic range depends on the measurement settings, such as peak power or integrated power. Dynamic range specifications are based on default measurement settings, with detector set to average, and depend on the mixer level. Default measurement settings include 100 kHz RBW.
- This dynamic range specification applies for the optimum mixer level, which is about -14 dBm. Mixer level is defined to be the average input power minus the input attenuation.
- The sensitivity is specified with 0 dB input attenuation. It represents the noise limitations of the analyzer. It is tested without an input signal. The sensitivity at this offset is specified in the default 100 kHz RBW, at a center frequency of 2.412 GHz.
- The relative accuracy is a measure of the ratio of the power at the offset to the main channel power. It applies for spectrum emission levels in the offsets that are well above the dynamic range limitation.

<b>CCK 11Mbps</b> (RF Input Level = -10 dBm, Attenuation = 10 dB, 20 to 30°C)		Radio standard is: 802.11/b/g (DSSS/CCK/PBCC) Center Frequency in 2.4 GHz Band  Reference Filter: Gaussian
EVM		
Floor <sup>ab</sup> (EQ Off)		-41.9 dB (0.80%) (nominal)
Floor(EQ On)		-54.0 dB (0.20%) (nominal)
Accuracy		
(EVM Range: 0 to 2.0%)		±0.90% (nominal)
(EVM Range: 2 to 20.0%)		±0.40% (nominal)
Frequency Error		
Range		±100 kHz (nominal)
Accuracy		±10 Hz + tfa <sup>c</sup> (nominal)

- In these specifications, those values with dB units are the specifications, while those with % units, in parentheses, are conversions from the dB units to % for reader convenience.
- The EVM Floor specification applies when Phase Noise Optimization is set to Wide-offset (>140 kHz)
- tfa = transmitter frequency × frequency reference accuracy.

## In-Band Frequency Range for Warranted Specifications

Description	Spectrum Range	Supplemental Information
Radio standard is 802.11b/g (DSSS/CCK/PBCC)	2.4 GHz Band	Channel center frequency = $2407 \text{ MHz} + 5 \times k \text{ MHz}$ , $k = 1, \dots, 13$
Radio standards are: 802.11a/g/j/p (OFDM), 802.11g (DSSS-OFDM), 802.11n (20 MHz), 802.11n (40 MHz) 802.11ac (20 MHz), or 802.11ac (40 MHz),	2.4 GHz Band	Channel center frequency = $2407 \text{ MHz} + 5 \times k \text{ MHz}$ , $k = 1, \dots, 13$
Radio standards are: 802.11a/g/j/p (OFDM), 802.11g (DSSS-OFDM), 802.11n (20 MHz) or 802.11n (40 MHz), 802.11ac (20 MHz) or 802.11ac (40 MHz), 802.11ac (80 MHz) or 802.11ac (160 MHz)	5.0 GHz Band	Channel center frequency = $5000 \text{ MHz} + 5 \times k \text{ MHz}$ , $k = 0, 1, 2, \dots, 200$
Radio standards are: 802.11 ah 1M/2M/4M/8M/16M	700 MHz ~ 1 GHz	Channel center frequency = Channel starting frequency + $0.5 \text{ MHz} \times$ Channel center frequency Index <sup>a</sup>

- a. Channel center frequency, Channel starting frequency and Channel Center Frequency Index are given by the operating class (Annex E) in IEEE P802.11ah<sup>TM</sup>/D2.1.

In-Band Frequency Range for Warranted Specifications

## 41 Version-Dependent Backdated Specifications

This chapter contains historic specifications for those PXA Signal Analyzers with certain versions of hardware or software that have not been upgraded.

## Specifications Affected by Versions of Instrument Hardware or Software

Beginning January 2015, all PXA instruments ship standard with the N9030A-NF2 (Noise Floor Extension, instrument alignment). Prior to that date, the N9030A-NFE (Noise Floor Extension, factory calibration) shipped standard. Unless an earlier PXA has been upgraded with N9030AK-NF2, its DANL performance with the NFE On follows specifications contained in this chapter. Upon powering on the instrument, press System> Show> System, to ensure the N9030A-NF2 is not included in the Option List before using specifications contained in this chapter.

Specification Name	Information
DANL with NFE (Noise floor extension, factory calibration) on but preamp is off.	See specifications in this chapter.
DANL with NFE on and preamp is on	See specifications in this chapter.
DANL with NFE on and <i>Option LNP</i> enabled	See specifications in this chapter.

## DANL Specifications with NFE on

Upon powering on the instrument, press System > Show > System, to ensure the N9030A-NF2 is not included in the option list before using specifications contained in this table.

Description	Specifications		Supplemental Information	
<b>Displayed Average Noise Level (DANL) (with Noise Floor Extension) Improvement<sup>a</sup></b>			<b>95th Percentile (<math>\approx 2\sigma</math>)</b>	
mmW (Option 543, 544, or 550)				
RF/ $\mu$ W (Option 503, 508, 513, or 526)				
			<b>Preamp Off</b>	<b>Preamp On<sup>b</sup></b>
Band 0, f > 20 MHz <sup>c</sup>	x	x	10 dB	9 dB
Band 1	x		4 dB	8 dB
Band 1		x	6 dB	5 dB
Band 2	x		7 dB	8 dB
Band 2		x	8 dB	8 dB
Band 3	x		7 dB	8 dB
Band 3		x	9 dB	8 dB
Band 4	x		6 dB	5 dB
Band 4		x	7 dB	6 dB
Band 5		x	6 dB	6 dB
Band 6		x	6 dB	5 dB
<b>Improvement for CW Signals<sup>d</sup></b>			3.5 dB (nominal)	
<b>Improvement, Pulsed-RF Signals<sup>e</sup></b>			10.8 dB (nominal)	
<b>Improvement, Noise-Like Signals</b>			9.1 dB (nominal)	

Description				Specifications		Supplemental Information
<b>Examples<sup>f</sup> of Effective DANL<sup>g</sup></b>						
<b>(18 to 30°C)</b>				<b>Preamp Off</b>	<b>Preamp On<sup>b</sup></b>

Mid-Band 4 (21.75 GHz)			x	–152 dBm	–165 dBm	
Mid-Band 5 (30.4 GHz)		x		–144 dBm	–160 dBm	
Mid-Band 5 (30.4 GHz)			x	–147 dBm	–162 dBm	
Mid-Band 6 (42.7 GHz)		x		–139 dBm	–154 dBm	
Mid-Band 6 (42.7 GHz)			x	–142 dBm	–156 dBm	

- a. This statement on the improvement in DANL is based on the accuracy of the fit of the noise floor model to the measured values of that noise. This measure of the performance correlates well with improvement versus frequency. The improvement actually measured and specified in "Examples of Effective DANL" usually meet these limits as well, but not with the confidence in some cases.
- b. DANL of the preamp is specified with a 50 $\Omega$  source impedance. Like all amplifiers, the noise varies with the source impedance. When NFE compensates for the noise with an ideal source impedance, the variation in the remaining noise level with the actual source impedance is greatly multiplied in a decibel sense.
- c. NFE does not apply to the low frequency sensitivity. At frequencies below about 1 MHz, the sensitivity is dominated by phase noise surrounding the LO feedthrough. The NFE is not designed to improve that performance. At frequencies between 1 and 20 MHz the NFE effectiveness increases from nearly none to near its maximum.

Version-Dependent Backdated Specifications  
DANL Specifications with NFE on

- d. Improvement in the uncertainty of measurement due to amplitude errors and variance of the results is modestly improved by using NFE. The nominal improvement shown was evaluated for a 2 dB error with 250 traces averaged. For extreme numbers of averages, the result will be as shown in the "Improvement for Noise-like Signals" and "Examples" sections of this table.
- e. Pulsed-RF signals are usually measured with peak detection. Often, they are also measured with many "max hold" traces. When the measurement time in each display point is long compared to the reciprocal of the RBW, or the number of traces max held is large, considerable variance reduction occurs in each measurement point. When the variance reduction is large, NFE can be quite effective; when it is small, NFE has low effectiveness. For example, in Band 0 with 100 pulses per trace element, in order to keep the error within  $\pm 3$  dB error 95% of the time, the signal can be 10.8 dB lower with NFE than without NFE.
- f. The noise is evaluated only at a frequency given by the center of the band plus  $\pi$  times 1 MHz. (We use an irrational offset from exactly midband to reduce the risk of uncovering residual responses at round-numbered frequencies, such as integer multiples of the 10 MHz reference frequency.) The center of the band is chosen because it is a highly representative frequency in the band. It is not worst-case, and usually better than the average case.
- g. "Effective DANL" is the DANL which would give equivalent amplitude errors to those observed with a signal about 4 dB above the uncompensated noise floor. Effective DANL can be a positive or negative amount of power; the expressed specifications are of the absolute value of that Effective DANL. Effective DANL is verified with measurement settings that are best for low level measurements, which is with the average detector, with Average Type = Power, and very large amounts of averaging.
- h. Specifications marked with an x in this column apply to analyzers with mmW frequency options (*Option 543, 544 or 550*) and none of the following options that affect the signal path: MPB, LNP, B85, or B1X.
- i. Specifications marked with an x in this column apply to analyzers with mmW frequency options (*Option 543, 544 or 550*) and one or more of the following options that affect the signal path: MPB, LNP, B85, or B1X.

## DANL Specifications with NFE on and *Option LNP* enabled

Upon powering on the instrument, press System > Show > System, to ensure the N9030A-NF2 is not included in the option list before using specifications contained in this table.
